in spite of the general feeling that business during September was good, the barometers of Texas business made a poor showing. The index of business activity in Texas, compiled by the Bureau of Business Research, declined $4 \%$ after adjustment for seasonal variation. The rather erratic character of this index during 1963 is evident in the chart below, but, if the monthly chart is smoothed, it appears that a turning point in the business cycle has not yet been reached. The continued hesitancy of the index to advance to higher levels, however, confirms the conclusion that the current expansion is slowing down.

## TEXAS BUSINESS ACTIVITY

Despite the downturn in September in the index of business activity, the first three quarters of 1963 registered a gain of $4.5 \%$ over the same period of 1962 . Although the two series are not strictly comparable, it is interesting to note that income payments to individuals in the United States increased $4.6 \%$ in the same period, and there are good grounds for concluding that Texas business has shown essentially the same improvement over a year ago as has the country as a whole.

Probably the most significant feature of Texas business in September was the decline in retail sales. The preliminary estimates of retail trade, compiled by the Bureau of Busines Research from a sample of stores, showed a decline of $11 \%$ from August to September, after allowance for seasonal variation. The estimate of September 1963 sales was $3 \%$ below sales of September 1962. This decline was substantial enough to account for a major portion of the drop in the index of Texas business activity. This decline in Texas paralleled the trend of retail sales for the United States, which dropped approximately a half-billion dollars from August.

Automobile sales in Texas declined $20 \%$ from the previous month, although a seasonal increase of $3 \%$ is normal for September. This decline can probably be explained by the low level of inventories of 1963 models, which left many dealers without cars to sell. However,

all types of durable goods showed a decline, even after allowance for seasonal variation.

Sales of nondurable goods stores in Texas also turned in a poor showing for September. Apparel store sales declined $12 \%$ in spite of the fact that a $10 \%$ increase in September is the normal pattern. Much of this decline can be blamed on the hot, dry weather, which has tended to cause consumers to postpone the purchase of fall clothing. To the extent that this explains the decline, it need cause no alarm, since the advent of cooler weather may be expected to produce the sales that did not materialize in the earlier month. It is also true that September had five Sundays and a major holiday, which would further reduce the volume of retail trade; however,

it appears that the decline cannot all be explained in this manner.

In light of the decline in retail sales, it is rather surprising to find that individual incomes apparently continued to rise during September. No data on total income are available for Texas, but the series on personal income compiled by the Department of Commerce for the United States rose $0.3 \%$ during September. Since this series is a very stable one, not given to sharp fluctuations either up or down, a rise of this amount is significant in interpreting Texas business conditions. Average weekly earnings in Texas manufacturing plants rose $1 \%$ during September and represented one of the few barometers to register an increase.

Adjusted for seasonal variation.
${ }^{* *}$ Change is less than one-half of $1 \%$.
Normally, consumer spending, after allowance is made for regular seasonal variations, is closely related to income. When retail sales do not respond to the stimulus of increased income, serious question may be raised as to the soundness of business.

The only barometer of Texas business to show an increase, in addition to average weekly earnings, was ordinary life insurance sales. The accompanying chart shows the steadily rising trend of insurance sales. The

level of 137.4 in September had been exceeded only in May 1963.

Crude petroleum production in September declined 3\%, and crude oil runs to stills declined $4 \%$. Total electric power consumption and industrial power consumption both increased slightly but each less than $1 \%$. The index of industrial production compiled by the Federal Reserve Bank of Dallas increased $3 \%$, compared to an increase of $0.1 \%$ for industrial production in the United States.

None of the above barometers offers much encouragement with respect to further increases in the level of Texas business, although certainly the present level is near an all-time high. There is much in the behavior of these indexes to suggest that the rising level of business is approaching a peak. Sometimes the change from a rising trend to a falling trend comes suddenly, and decline is violent. At other times the rate of increase levels off gradually until a decline has set in. There is no evidence at present to indicate that a sharp break is imminent, but the signs indicate that the upswing is losing some of its vigor.

Building construction authorized during September declined $17 \%$ after adjustment for seasonal variation. The September level was $5 \%$ ahead of last year, but the volume of building authorized to date this year was only $2 \%$ larger than for the first three quarters of last year. Steadily increasing volume of building has been one of the mainstays of the current upswing of business, and 1963 is running close enough to last year to lend support to the thesis that the current expansion is losing some of its momentum.

New construction in the United States is farther ahead of last year than it is in Texas. September showed only a slight rise from August, but the level was $7 \%$ above a year earlier. A sharp rise has occurred since last spring, and September rose slightly to set a record for the second consecutive month.

The rate of unemployment in 18 labor market areas in Texas declined from $4.7 \%$ to $4.1 \%$, bringing the average for the first three quarters of 1963 to $4.7 \%$, compared with $4.6 \%$ for the same period last year. It should be noted, in comparing Texas with the United States, that the Texas rate is not adjusted for seasonal variation. The seasonally adjusted unemployment rate for the United States rose from $5.5 \%$ to $5.6 \%$, the same level as in September 1962. The labor force time lost through unemployment and part-time work in the United States during September was unchanged from August.

# 1962 PERSONAL INCOME IN TEXAS: 

## A NEW HIGH

by Francis B. May

at $\$ 20.36$ bilhion in 1962, texas personal income was at an all-time high, having increased $4.4 \%$ over its 1961 value of $\$ 19.50$ billion, according to a report published recently by the Office of Business Economics, U. S. Department of Commerce. Personal income is the current income received by individuals from all sources and is a major guide to consumer purchasing power. Table 1 compares Texas personal income with that of other states in this region and shows that the Southwest (defined as the states of Texas, Oklahoma, New Mexico, and Arizona) received $6.8 \%$ of total United States personal income in 1962. Texas received $4.6 \%$ of United States personal income and $67.8 \%$ of Southwest personal income in that year. This means that the citizens of Texas had $4.6 \%$ of total United States purchasing power and $67.8 \%$ of all of the purchasing power of the four southwestern states.

Table 1
TOTAL PERSONAL INCOME IN THE SOUTHWEST IN 1862 (Billions of dollars)

| Arizona | \$ 3.16 |
| Oklahoma | 4.66 |
| New Mexico | 1.86 |
| Texas | 20.36 |
| Total, Southwest | \$ 30.04 |
| United States | \$489.66 |

Source: U. S. Department of Commerce, Survey of Current Buainese, August 1963.

Only five states (New York, Ohio, Pennsylvania, Illinois, and California.) had total personal income exceeding that of Texas in 1962. (See Table 2.) Personal income in these five states totaled $\$ 180.07$ billion. If Texas income is added to this total, these six states had 1962 income of $\$ 200.43$ billion, or $45.6 \%$ of the national total. This means that $45.6 \%$ of the national market for consumer goods lies in these six states.

Table 3 contains a summary tabulation of the sources of personal income in the state. Before discussing the contents of the table, an explanation of the reasons for selection of the dates of comparison is in ordex. The first year, 1929, was the last prosperous year of the great boom of the 1920's. It witnessed the end of "Coolidge prosperity." Nineteen forty-six was the first post-World War II year, and it was the first of many boom years in the late forties and fifties. The last year of the catch-up period in which accumulated shortages of consumer and producers' goods were being satisfied was 1957. From 1957 to 1961 replacement demand, population growth, and
change in age composition were the sustaining factors upholding business activity. Nineteen sixty-two was added to the comparison as the most recent year for which official data from the U. S. Department of Commerce are available.

The rise in importance of wage and salary income is striking. (See Table 3.) In 1929, wages and salaries amounted to $\$ 1.4$ billion, or $51.1 \%$ of total personal income. By 1946, this category amounted to $57.0 \%$ of personal income. In the most recent year, 1962, wages and salaries amounted to $\$ 13.3$ billion, or $65.1 \%$ of total personal income in the state. Texas has ceased to be a state of small farmers and businessmen; today, virtually two-thirds of total income is received as pay to employyees.

Proprietors' income is divided into two categories in Table 3-farm proprietors' income and nonfarm pro-

Table 2
STATES WITH TOTAL PERSONAL INCOME IN EXCESS OF TEXAS PERSONAL INCOME IN 1962
(Billions of dollars)

prietors' income. Income received by farm proprietors has increased in amount from $\$ 454$ million in 1929 to $\$ 933$ million in 1962; however, it has declined in relative importance from $1.6 .5 \%$ of total personal income in 1929 to $4.6 \%$ of the total in 1962. Nonfarm proprietors' income also has risen from $\$ 345$ million in 1929 to $\$ 2.03$ billion in 1962. It, too, has declined in relation to total personal income from $12.5 \%$ in 1929 to $9.9 \%$ in 1962, however. Proprietors' income has not kept pace with the rise in total state personal income.
Property income has also declined in relative importance, from $17.8 \%$ of personal income in 1929 to $13.0 \%$ in 1962. The rise in property income was not as rapid as the total, although the amount rose from $\$ 489$ million in 1929 to $\$ 2.65$ billion in 1962 .

The categories that have increased in importance since 1929 are wages and salaries paid in mining, contract construction, manufacturing, trade, finance, communication, services, and government. Outside the wage and
salary sector, transfer payments is a category that has grown in amount and relative magnitude.
Of the $\$ 718$ million of wage and salary income received by persons working in the state's mining industries in 1962, $\$ 683$ million was paid by the oil and gas industries. The remaining $\$ 35$ million was paid by concerns mining and quarrying nonfuel minerals. From 1932 until 1957, wages and salaries paid by oil and gas producers in the state rose from $\$ 51$ million to $\$ 678$ million. The problems which slowed growth of the oil industry caused wage and salary disbursements to remain below the 1957 peak of $\$ 678$ million until 1962, when a rise of $\$ 4$ million, or $0.7 \%$, occurred. From 1946 to 1957 , the average annual rate of increase in this source of income was $10.2 \%$. An annual increase of $2 \%$ to $3 \%$, about the same as the rate of growth of domestic oil demand, would be a welcome addition to total income today. A $2.5 \%$ increase a year from 1957 to 1962 would have raised this figure to $\$ 767$ million, some $\$ 84$ million above the 1962 figure. As a result of faltering economic forces in this area, its contribution to total personal income has declined from $4.4 \%$ in 1957 to $3.5 \%$ in 1962 .

The share of total personal income contributed by contract construction has risen from $2.9 \%$ in 1929 to $3.9 \%$ in 1962. The boom in construction has been a sustaining factor in the state's economy since World War II. In August of this year there were 198,300 production workers employed in contract construction, according to data supplied by the Texas Employment Commission. This was
$7.3 \%$ of total nonagricultural employment in the state in that month.

Personal income originating in manufacturing rose from $7.8 \%$ of the total in 1929 to $13.1 \%$ in 1962. In 1961, the latest year for which a Survey of Manufactures is available, Texas had a total of 485,018 manufacturing workers, including white-collar employees. The net value of their output, subtracting cost of materials consumed, was $\$ 6.0$ billion.
Personal income originating in wholesale and retail trade was one of the larger items in the 1929 total, amounting to $11.5 \%$. In 1962 , it was still a major category $-12.9 \%$ of the total. This category has risen more slowly than manufacturing, which has almost doubled in importance since 1929.

Employees of finance, insurance, and real estate firms received $2.5 \%$ of total personal income in 1929 and $3.1 \%$ in 1962, a significant growth. August 1963 employment in this industry was 145,100 nonmanagerial workers, making the industry one of the state's larger employers.
Personal income paid as salaries and wages by communications and public utilities firms rose from $1.8 \%$ of the total in 1929 to $2.2 \%$ in 1962. Output in these industries has grown more rapidly than salaries and wages because of a high degree of automation in both. Another way of describing these two industries is that they have relatively high capital inputs per unit of output and relatively low labor inputs.

The growth of the fraction of total personal income in

the state paid as wages and salaries to employees in service industries indicates a shift of labor resources out of more highly automated industries and into less automated service occupations. This shift will continue in the future.

Government is not usually thought of as a "growth industry." Examination of Table 3 shows that government qualifies as a growth industry from the point of view of producing a rapid rise in personal income. In 1929 a substantial $5.8 \%$ of total personal income was paid as wages and salaries of employees of local, state and national government. In 1962 the percentage had grown to 13.8 , more than double the 1929 figure. The 1962 amount was $\$ 2.8$ billion, of which $\$ 713$ million was federal civilian salaries, $\$ 773$ million federal military salaries, and $\$ 1.3$ billion salaxies of state and local govermment employees. Rising costs of state and local government were due in large part to rapidly increasing costs of education and to a growing level of welfare costs. There were $48,704,000$ students in the nation enrolled in grades from kindergarten through graduate school at a college or university in October 1962. This was an increase of $18,428,000$ over the number enrolled in the fall of 1950 . The bulk of these students are in government-supported schools, colleges, and universities. Education deserves to be classed as a major industry in this country and in Texas.

Transfer payments (money disbursed by business and government for which no services are rendered) have
shown phenomenal growth, rising from $1.6 \%$ of total personal income in 1929 to $6.7 \%$ in 1962. This is a fourfold increase. Government pensions, social security, and veterans' insurance dividends have swelled this total over the years. It is not subject to significant changes due to business cycles but rather tends to grow steadily as the number of old age pensioners increases. For this reason, it is a stabilizing factor in the state's economy.
A comparison of changes in the composition of personal income for the nation yields some useful generalizations about the Texas economy. Table 4 is analogous to Table 3 ; it shows amounts and percentages of United States personal income for the same years and categories.
The percentage of personal income derived from mining in the nation has declined from 1.8 in 1929 to 0.9 in 1962, largely because of the decline of the coal industry. Natural gas and oil have taken many of coal's marketsnearly all, in fact, except the electric power generating industry. Currently, all fuel mining is highly automated; the degree of automation increases yearly. This lowers labor inputs relative to total output with a corresponding slowing of the growth of personnel income in the sector.

Contract construction in the nation has a pattern of growth quite analogous to the Texas patterm, rising from $2.9 \%$ of the 1929 total to $3.8 \%$ of the 1962 total.

Texas' relative deficiency of manufacturing employment and personal income shows up clearly when a comparison

[^1]is made with national totals. In 1962 personal income paid as wages and salaries in manufacturing was $21.4 \%$ of the national total. The comparable Texas figure was onily $13.1 \%$.

Another interesting trend in the fraction of national wage and salary income derived from manufacturing is revealed by comparing 1957 with 1962. Manufacturing income reached its maximum percentage in 1957, declining thereafter. The national maximum was $23.4 \%$ of the total, while the Texas maximum was $14.0 \%$ of the total.

Services increased its percentage of national personal income from 6.4 in 1929 to 7.3 in 1962.

Govermment contributed $5.6 \%$ of national personal income in 1929 and $12.1 \%$ in 1962 , a more than twofold increase.

## Table 5

ANNUAL TEXAS AND UNITED STATES PER CAPITA PERSONAL INCOME AND PERCENT CHANGE,

1952-1962

Source: U. S. Department of Commerce, Survey of Current Business, August 1963, and Bureau of Business Research.

Transfer payments showed a very great increase from $1.7 \%$ of national personal income to $7.9 \%$ between 1929 and 1962, almost a fivefold increase.

It is clear that increases in wages and salaries derived from manufacturing, government, and transfer payments between 1929 and 1962 were characteristic of both Texas and the nation. Declines were experienced by proprietors' income and property income. About two-thirds of all personal income was paid as wages and salaries.

Income is the basis of each income receiver's standard of living. Regional or national per capita personal income is an index of relative growth of income in terms of the population it must sustain. Per capita income is local personal income divided by total population. Not every person is an income receiver, but all must be sustained by the income receivers. Table 5 compares per capita income in Texas and the United States and the percentage growth or decline in these figures from year to year during the 1952-1962 period. The average rate of increase compounded annually was $3.27 \%$ for the nation and $3.08 \%$ for Texas. The last four years in Table 5 show that United States per capita income usually had the higher rate of year-to-year increase. This tendency must be reversed. Measures designed to foster increased tourism and industrialization must be adopted, or Texas will find itself lagging in economic growth in the years ahead.

## TEXAS RETAIL TRADE IN SEPTEMBER

ESTIMATES OF TOTAL RETAIL SALES

with five sundays and a holipay leaving only 24 trading days in September, a misleadingly dismal $115.2 \%$ of the 1957-59 average, a 1963 low, was all the index of total retail sales in Texas could muster for September. At $114.3 \%$ of the base period average, also a 1963 low, the index of durable goods sales more nearly reflected the circumstances in that category. The seasonally adjusted index of nondurables attained a September level of $115.7 \%$ of the average, a decline of almost $7 \%$ from August but a return to the fairly consistent pre-August levels of this index.

Because these data are not adjusted for trading day differences, the October figures must become available before any meaningful analysis of September sales trends can be made. The trends over the first nine months of this year and, to a lesser extent, of the third quarter are reasonably clear.
The index of total sales attained its highest levels in June, July, and August, influenced first by the durable goods index, which generally rose through May to a peak in June, and then by the index of nondurables, which attained its third highest and highest levels in July and August. The durables index reached its third highest level of the year in August, helping push the total index to its year's high of 129.7 during that month.

Beginning in the late spring, then, toward the end of the second quarter, and continuing throughout the summer, retail trade generally was rather brisk throughout the state. The first quarter activity, not generally inspiring, was maintained largely by automobile sales, and
the index of total retail sales rose gradually to its August peak, with only a small decline from March to April and from June to July.

At the beginning of the second quarter, the nondurables, led by the apparel stores during the Easter buying season in April, offset a $6 \%$ sag in the durable goods index to prevent more than a downward ripple in the upward progress of the total sales index. As nondurables buying fell off to January levels toward the end of the second quarter, automobiles and other durables recovered rapidly, generally coming up at least to seasonal expectations and maintaining the briefly interrupted rise in the index of total sales.

| Other retail storest.. | . . . 240 | +2 | - 8 | +2 | + 2 |

[^2]Although durables briying slowed somewhat as the third quarter began, nondurable sales picked up again, led by unseasonable success in apparel and general merchandise. Two of the three major categories of durable goods sold unusually well for August, and that index rose to its third highest level of the year. Nondurables activity in August was better than average for the month in all but three categories, only one of which failed to attain the customary August level. At its third highest level for the year, the index of durable goods sales reflected the activity which nudged the index of total sales to the year's high of $129.7 \%$ of the 1957-59 average.

The general strength and surprising consistency of several categories of nondurable goods are illustrated by the fact that, during the first three quarters, every nondurable category performed, on the average, better than the seasonal expectations. The major durables, on the other hand, failed to average levels consistent with seasonal experience. All of these averages were depressed somewhat by the inclusion of September figures.

## TEXAS CONSTRUCTION

 IN SEPTEMBERby James J. Kelly

THE SEASONALLY ADJUSTED YNDEX OF TOTAL CONSTRUCTION authorized in Texas dropped in September to $110.0 \%$ of the average value of authorizations for the 1957-59 base period. This was a $17 \%$ decrease from the index of total building permits issued in the state in August. The decline in September authorizations reflected a cutback in permits issued to build both residential and nonresidential buildings. The larger categories showing declines were one-family dwellings and apartment buildings in the residential sector, and, in the nonresidential category, hospitals, stores, and mercantile buildings.

The index of total construction authorized in the state in the third quarter of 1963 averaged 127.5, an increase over the average of 119.7 recorded in the third quarter of 1962. Thus far in 1963, butilding permits in Texas are showing gains over 1962. The average of the

[^3] firt of the month.
total index was 127.8 for the first nine months of 1963 , an increase of $3.4 \%$ over the mine-month average in 1962 of 123.6 .

The index of residential construction authorized in Texas in September declined to $113.4 \%$ of the base period value, a drop of $17 \%$ from the level of 137.2 reported for August. Despite the decline, residential permits in the state continue to be issued at a high level. The seasonally adjusted index averaged 133.2 for the third quarter of 1968 , an increase of $11.3 \%$ over the average of 119.7 for the same period in 1962. In the first nine months of 1963, the residential index averaged 123.1. This was an increase of $4.9 \%$ above 117.4 , the average value of the index for the first three quarters of 1962 .

For the first time this year, the September index of nonresidential construction authorized in Texas dropped below the 1957-59 base period value. In September, the nonresidential index was 95.4 , a decline of $28 \%$ from the August level but less than $1 \%$ change from the September 1962 figure. The volume of permits issued for the construction of nonresidential buildings in Texas varies considerably from month to month. Even though 1962 was a record year in this category the index dipped below the 1957-59 average three times. Because of the large monthly variation, quarterly comparisons have more validity. Tn the third quarter of 1963, nonresidential permits were issued at about the same rate as in the third quarter of 1962. However, the nine-month average of the index for 1963 reveals a weakening of this category for this year. In nine months of 1963 , the average of the nonresidential index was 133.9 , a slight drop from the 135.0 average of the index in the same period of 1962 .

The total value of building authorized in Texas in September was estimated to be $\$ 112.8$ million, a decline of $14 \%$ from the August estimated total of $\$ 131.0$ million. The dollar value of building permits issued in Texas for the first nine months of 1963, however, was $3 \%$ greater than the estimate for the same period of 1962. Building construction authorized in Texas in 1963 totaled almost $\$ 1,200$ million in the first three quarters compared with a total valuation of $\$ 1,168$ million in the same three quarters of 1962.

Residential permits issued had an estimated value of $\$ 63.3$ million in September, and permits issued for construction of nonresidential buildings were estimated at $\$ 35.8$ million. Both categories showed decreases in September from August; residential permits dropped $20 \%$ in value, and nonresidential permits dropped $9 \%$. Even though the total value of permits issued is higher in 1963 than it was in 1962, the breakdown shows that all of the increase must be attributed to a $5 \%$ rise in the value of residential permits issued, since the value of permits issued for nonresidential buildings was down $2 \%$ for the nine-month period last year.

The value of permits issued to build apartment buildings declined $48 \%$ in September to $\$ 14.1$ million from
the value recorded in August of $\$ 27.1$ million. Authorizations to build apartments in spite of this one-month drop, have been good in 1963, and in nine months have increased $40 \%$ over the value for the first nine months of 1962. This growth did much to bolster the residential construction industry this year since the value of permits to build one-family dwellings actually declined in the state for the first three quarters by $6 \%$ when compared with the first three quarters of 1962.

## ESTIMATED VALUE OF BUILDING AUTHORIZED

Source: Bureau of Business Rescarch in cooperation with the Bureau of the Census, U. S. Depaxtment of Commerce

|  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

With the exception of the metropolitan areas of Austin, Corpus Christi, For't Worth, Laredo, San Angelo, and Waco, the other metropolitan areas of the state showed declines in the first three quarters this year in the value of permits to build one-family residences, Conversely, the four metropolitan areas of Beaumont-Port Arthur, Brownsville-Harlingen-San Benito, Houston and Lubbock were the only areas showing decreases in the value of apartment permits issued in the nine-month comparison.

As a reader's guide to better utility of retail sales data, an average percent change from the preceding month has been computed for each month of the year. This percent change is marked with a dagger ( $\dagger$ ) following that figure. The next percent change represents the actual change from the preceding month. A large variation in the actual figure from the normal seasonal represents an abnormal month. The third percent change shows the change from the identical period the preceding year. Postal receipt information which is marked by an asterisk (*) indicates cash receipts received during the four-week postal accounting period ended September 13, 1963, and the percent changes from the preceding period and the comparable period in
the previous year. Annual postal data are for 13 four-week periods falling closest within 1962 and 1963 calendar years. Changes of less than one-half of 1 percent are marked with a double asterisk (**). Waco retail sales information is reported in cooperation with the Baylor Bureau of Business Research. End-of-month deposits as reported represent money on deposit in individual demand deposit accounts on the last day of the month and are indicated by the symbol ( $\ddagger$ ). All population figures are final 1960 census data with the exception of those marked ( r ), which are estimates of the Texas Highway Department. Figures under Texarkana with the following symbol (§) are for Texarkana, Texas, only.

## BAROMETERS OF TEXAS BUSINESS

All figures are for Texas unless otherwise indicated. All indexes are based on the average months for 1957-59, except where indicated; all are adjusted for seasonal variation, except annual indexes. Employment estimates are Texas Employment Commission data in cooperation with the Bureau of Labor Statistics of the U. S. Department of Labor. The index of Texas business activity is based on bank debits in 20 cities, adjusted for price level. An asterisk ( ${ }^{\circ}$ ) indicates preliminary data subject to revision. Revised data are marked (r).
