Business Review and Prospect

General Business

Activity in the basic industries of the country and in trade has been so near capacity during the past several months that the usual increase in industrial production for this season of the year is not taking place. As a consequence, after adjustment for seasonal variations, as well as for long-term trend, Barron's index declined from 105.4 in July (the highest reached since 1929) to 102.5 during the second week in September. It is expected, however, that the index will attain new highs in the near future in view of the greater capacity for production in many basic industries resulting from the plant expansion program for national defense purpose, which new capacity is now being put into operation. In the meantime, the demand for goods is increasing rapidly both for meeting of defense and civilian needs, insuring full utilization of the added plant capacity.

It was pointed out in the May issue of the REVIEW that although the total output of industry and trade was then at the highest level in our history, boom conditions were not uniform throughout the country, and unemployment was still a serious problem in many localities. It was further stated that "as the national defense program gains momentum, even more stringent restrictions will have to be imposed upon certain types of consumer goods industries, thus intensifying the disparities in business and employment conditions throughout the country."

The "spotty" character of the national industrial picture just referred to still remains, but there are encouraging signs that energetic measures are in progress for ameliorating the situation. At best it will take time to bring about even the more urgent adjustments. Communities which have depended largely upon pay rolls of highly specialized industries producing durable consumer goods with wide markets, such as household appliances and aluminum ware, are especially vulnerable to the operation of the priorities system. The urgent problem is to distribute defense contracts among such industries; and the recent appointment of Mr. Floyd B. Odlum to head up O. P. M.'s Division of Contract Distribution gives ground for growing optimism that the threatened acute unemployment in many of these communities will be averted entirely, or that at least the period of unemployment will be of relatively short duration.

TEXAS BUSINESS

In the July issue of the Review it was stated: "There are growing indications that during the coming months the Texas composite business index will show greater gains than will the national business indexes." Since then, Barron's business index for the country as a whole has actually declined, while the Texas composite business index has risen sharply—the gain for the latest month having been the greatest for a single month since the index was started.

All of the components of the index for the month of August were far above those of the corresponding month a year ago, and all except the one representing runs of crude oil to stills were well above July.

INDEX OF BUSINESS ACTIVITY IN TEXAS (Average Month of 1930=100%)

1941	Aug. 1940	. July 1941
104.3	90.3	102.9
123.0	95.9	118.8

*Revised.

Although it is not expected that the phenomenal gain in the index which occurred from July to August will be repeated during the coming months, there is nothing in the business horizon of the State which would indicate anything more than a temporary decline, at most, from the present high levels. It is more than likely that an even higher level than the present will be reached before the end of the year.

Local variations in business conditions are less pronounced in Texas than in the country as a whole, although there is considerable disparity even in this State. Living costs, also, appear to vary within the State, and the extent of such variation is now in process of being determined by this Bureau.

Attention is called to the chart on the cover page of this issue of the REVIEW for a picture of the distribution of the main items of family expenditures in the various income groups. It will be noted that while food costs constitute the largest single item in each income group, the percentage expended for this purpose declines sharply from the lowest to the highest income group. Since food embraces a wide range of items and satisfactory substitutes of lower-cost foods for those of higher cost (but of no greater nutritional value) can readily be made, total food costs may not be rising so rapidly as is currently supposed, when only certain items are taken into account. Such substitutions will obviously be made most promptly in the lower income groups in order that the amount allotted for food may purchase the maximum of nutritional value.

FARM CASH INCOME

If present indications are borne out, farm cash income in Texas (exclusive of government subsidies) during 1941 will equal from eighty-five to ninety per cent of the amount—700 million dollars—received in 1929. In only one year of the past decade—1937—has farm cash income even remotely approached that which will be received by Texas farmers this year. Including government subsidies (assuming that these will about equal the average payments of the past two years) the cash received by the farmers of the State during the current

year will be the greatest since 1928, when it reached

approximately 800 million dollars.

It is probable that the purchasing power of Texas farmers during the current year may equal that of the best years of the '20's because of the lower costs of merchandise, the scaling down of and lower interest rates on farm mortgages which occurred during the depression years, government-sponsored farm operating credit both intermediate and short-term, and miscellaneous benefits such as are being derived from the extension of the rural electrification program under both private and government sponsorship. Added to the foregoing factors are the vast improvements which have taken place in the State's transportation system, both rail and highway, the benefits of which are being shared by the farmers in common with all citizens of the State.

Unfortunately, the improved agricultural situation is not being shared uniformly throughout the State. Even with prices of cotton lint again approaching the level which prevailed in the '20's and the price of cottonseed well above the average of that period, total income in 1941 from cotton and cottonseed will equal only about half that received from these sources during 1927 and 1923. Even of this sharply reduced total income from cotton and cottonseed, the older cotton producing regions of the State—central, eastern and southern Texas—will receive a much smaller proportion than in the decade of the '20's while the newer cotton producing regions of north and northwest Texas will receive a larger proportion. Part of the current disparity in farm cash income of the different sections of the State is the result of unfavorable weather conditions during the cotton planting season this year which may not soon be repeated in quite the same way; but much of the variation is the result of the acreage reduction program of the government which must be considered at least relatively permanent, and which is having a variety of effects in the different geographic areas.

Compared with the decade of the '20's, cotton acreage in Texas has been reduced fifty per cent or by about 8,000,000 acres. The impact of this drastic curtailment fell with special force on those regions of the State in which the proportion of land devoted to cotton was greatest and where accordingly the tradition of cotton farming was most deep seated. For a number of significant reasons, which cannot be developed within the scope of this article, the agricultural readjustments are most difficult to make in the very regions where the need for such readjustments is most urgent. As a consequence, we have in Texas agriculture today a range of economic conditions affecting wide areas which vary all the way

from depression to prosperity.

Analysis of the quantitative economic aspects of Texas agriculture has been greatly simplified by the fact that the agricultural statistics of the State are compiled by crop reporting districts which are based upon "Natural Regions of Texas" a publication of this Bureau written by Elmer H. Johnson. Not only has the quantitative analysis been simplified, but the regional approach has made possible a cleancut statistical stratification of the agricultural data which it is doubtful could have been accomplished in any other way.

The wide disparity in farm cash income among the crop reporting districts is shown in the following tabulation of indexes of farm cash income in Texas and in each of the crop reporting districts of the State. Actual farm cash income for the State and for each district during the first eight months of the year is also given together with a footnote stating the limitations of these figures.

*Revised.

Nozz: Farm cash income as computed by this Bureau understates actual farm cash income by from 6 to 10 per cent. This situation results from the fact that means of securing complete local marketings, especially by truck, have not yet been fully developed. In addition, means have not yet been developed for computing cash income from all agricultural specialities of local importance in scattered areas throughout the State. This situation, however, does not impair the accuracy of the indexes to any appreciable extent.

It will be noted that the index of income in the old cotton districts-4, 5, and 8-embracing East Texas and the Black Prairie Lands extending from the Red River through central Texas, is extremely low. Harvesting in these districts, it is true, is later than usual, ginnings through the month of August having been less than onethird those of the corresponding period last year, thus accounting in part for the relatively low income. But inasmuch as the estimated production in these three districts during the current season is only about half that actually harvested during the base period, 1928-1932, the farm cash income in this part of the State will continue to be relatively small when expressed as a percentage of that period.

In marked contrast with the current low relative income from the three old cotton districts mentioned above is the sharp current increase in the percentage of income over that during the base period in a number of districts in North and West Texas. Moreover, these districts promise to maintain this comparatively high level of improvement not only because of the favorable livestock conditions which prevail there but also because of the relatively high income expected from cotton. With prices of cotton and cottonseed nearly double those of a year ago and the indicated production of cotton greater than that of last year in these districts the outlook for a sharp gain in income from this source is highly promising. With good yields of both forage crops and cotton, with both range and livestock in excellent condition and with the highest level of prices for these products in many years, Northwest and West Texas will continue their comparatively high level of income for the remainder of the year at least.

Although income from cotton and cottonseed during the current year will be substantially above that of a year ago because of the marked increase in cotton prices, it is not likely that the proportion of the total farm cash income derived from this source will increase appreciably over 1940. The reason for this is that the increase in income from livestock and livestock products will be fully as great, if not greater, than that from cotton. As a result, no marked change in trends from those shown in the following table are to be expected.

It should be noted that the percentage of the total income derived from cotton in Texas dropped from sixty-seven to less than forty between 1927 and 1940 inclusive, while that from livestock increased more than fifty per cent; and from livestock products and fruits and vegetables, the increase was two hundred per cent.

Fortunately for the farmers and ranchmen of Texas these trends in relative importance of the various branches of Texas agriculture are in line with the recommendations as recently set forth by Secretary Wickard over the radio, in the press and through an intensive educational program in agricultural meetings and conferences.

Note: These data are furnished the Agricultural Marketing Service, U.S.D.A. by railway officials through more than 1,500 station agents, representing every live stock shipping point in the State. The data are compiled by the Bureau of Business Research.

Cotton Situation

The cotton situation is in flux and uncertainty in regard to all major aspects, supply, especially current production, and markets—particularly foreign markets and prices. There is uncertainty about the size of the crop being picked, with the majority apparently believing that the final out-turn will prove less than the present government estimate of 10,710,000 bales, making a free supply of United States grown cotton in the United States for the year, 1941–1942, of something over 16,000,000 bales, disregarding portions of this crop which have gone or may go into government loans.

The bill freezing government loan stocks has been vetoed; it is expected that there will be shipped out to the Allies, and especially to Great Britain, about 500,000 to 700,000 bales under lease-lend, to be taken from government-owned stocks of about 6,000,000 bales; and estimated marketings of free cotton abroad does not exceed 600,000 bales. Government-owned stocks accumulated under the loan for 1934 could be sold now for about 15.50 cents as a minimum and those acquired in 1937 at about 12.15 cents. The current price of cotton is about 17.50 cents. The amount, however, of cotton in these loan stocks is now less than 200,000 bales.

The value of the cotton crop of the United States this year bids fair to exceed a billion dollars for the first time since 1929, and that amount seems definitely assured if benefit payments are added.

The income to farmers in Texas will be about \$300,000,000 if present prices are maintained; this is a gain of nearly \$100,000,000 for Texas over last year.

Prices in foreign countries of foreign grown cotton are at about their lowest levels in history compared with prices of American cotton. Number one Oomra, which is normally about seventy-nine per cent of American M. 7/8 inch, is only about forty-nine per cent. Sao Paulo, number five, which is normally about ninety per cent of American, is only about fifty-three per cent.

These wide disparities between the price of American and foreign-grown cotton in foreign markets has revived strong sentiment in favor of revival of export subsidies on American cotton to aid in at least keeping a foothold in foreign markets.

In the meantime, it is estimated that farmers are holding well over fifty per cent of the cotton being ginned.

tPowdered eggs and canned eggs are converted to a shell egg equivalent on the following basis: I rail carload of powdered eggs = 8 carloads of shell eggs, and 1 carload of frozen eggs = 2 carloads of shell eggs.

Note: These data are furnished to the Agricultural Marketing Service, U.S.D.A., by railroad officials through agents at all stations which originate and receive carload shipments of poultry and eggs. The data are compiled by the Bureau of Business Research.
