MONITORING COASTAL FINFISH RESOURCES
FOR SPORT FISH MANAGEMENT
OCTOBER 1978-SEPTEMBER 1979

EXECUTIVE SUMMARY

Finfish in Texas bays support important and valuable commercial and recreational industries. Commercial fishermen in the Texas bay systems (Galveston, Matagorda, San Antonio, Aransas and Corpus Christi Bays and Laguna Madre) reported landing 4,049,700 lb of fish during September 1977-August 1978 (McEachron 1980). During the same period recreational fishermen harvested an estimated 1,619,000 lb of fish from these same bay systems. Six species--spotted seatrout (Cynoscion nebulosus), red drum (Sciaenops ocellata), black drum (Pogonias cromis), sheepshead (Archosargus probatocephalus), southern flounder (Paralichthys lethostigma) and Atlantic croaker (Micropogon undulatus)--accounted for 95.0% of the total weight caught by commercial fishermen and 81.0% of the total weight caught by sport fishermen.

Estimates of the harvest and availability of the finfish resource are necessary in order to evaluate and implement management decisions effectively. Commercial harvest statistics have been collected by the Texas Parks and Wildlife Department (TPWD) since 1936. Collection of marine recreational harvest and pressure statistics were initiated by the Department in 1974 (Heffernan et al. 1976).

Fish availability and gear selectivity studies have been conducted periodically along the Texas coast since the late 1800's. Information has been gathered on species diversities, relative abundances and life histories of commercially and recreationally important fishes.

In November 1975 the Coastal Fisheries Branch of TPWD initiated a standardized program for gathering comparable information on the availability of the finfish resources in Texas bay systems. In addition to gathering baseline data, various gear types and techniques were evaluated from November 1975 to September 1978.

In October 1978 the U. S. Department of Interior, Fish and Wildlife Service, approved a 5-yr program to continue monitoring trends in abundance and sizes of recreationally (and commercially) important saltwater fishes. This report is the summarization of the data collected during the first year.

Gill nets, trammel nets and bag seines were utilized during October 1978-September 1979 along the shoreline in each of seven Texas bay systems (Galveston, Matagorda, San Antonio, Aransas and Corpus Christi Bays and the upper and lower Laguna Madre) to monitor the trends in abundance and size of the recreationally important saltwater fishes: red drum, spotted seatrout, black drum, sheepshead, southern flounder and Atlantic croaker. During the same period, the trends in availability and size of the six species in the East Matagorda Bay system were randomly selected within each bay system. Gill nets were used during the night only, trammel nets and bag seines during the day only. Catch rates and mean fish size (total length) were determined on a monthly basis for selected species caught in each mesh size and in the total net.

Except in Aransas and Corpus Christi Bays, the annual mean catch rates with gill nets of red drum, spotted seatrout and black drum were higher than those of sheepshead, southern flounder and Atlantic croaker within each bay system (Table A). Atlantic croaker were caught with the least regularity, regardless of month or bay system. The highest annual catch of spotted seatrout (0.62 fish/h) and black drum (0.84 fish/h) occurred in the lower Laguna Madre. The highest catch of red drum (0.85 fish/h) occurred in the Matagorda Bay system.

Highest annual mean catches with trammel nets of red drum (1.14 fish/acre) and spotted seatrout (1.33 fish/acre) occurred in Matagorda Bay and the lower Laguna Madre, respectively (Table B). Annual catches of black drum were highest in Matagorda (2.17 fish/acre). Trammel net catches of sheepshead, southern flounder and Atlantic croaker did not exceed 1.00 fish/acre in any bay system. Mean annual catches of red drum, spotted seatrout and Atlantic croaker with trammel nets generally exceeded 0.40 fish/acre; black drum, sheepshead and southern flounder catches generally were < 0.40 fish/acre.

The lower coast bay systems yielded the highest catches of red drum with bag seines (> 11 fish/acre); the upper coast bay systems yielded the highest bag seine catches of spotted seatrout, black drum, sheepshead and Atlantic croaker (Table C). Southern flounder catches with bag seines were \leq 1.26 fish/acre in each bay system.

Table A. Annual mean catch rate (no/h) and mean total length (in) of fishes caught with gill nets (all meshes combined) in Texas bay systems during October 1978-September 1979.

ACKNOWLEDGEMENTS

We would like to express our appreciation to each current member of the Bay Finfish Monitoring Program who diligently collected all scheduled samples. A special thanks is due those members who have contributed to the success of the program over the years -- Bill Harshaney, John Key, Jim Dailey, Lex Sutton, Steve Marwitz, John Chupe, Hal Osburn, Antonio Buenano, Richard Harrington and Marshall Smith. Al Green provided invaluable assistance in writing the computer programs for data storage, retrieval and summarization. Thanks also go to Patricia Johansen, Roy Johnson and Tom Heffernan for reviewing the manuscript and to Elaine LeBlanc and Dolores Kleypas for typing it.

This study was conducted with partial funding from the U. S. Department of Interior, Fish and Wildlife Service, under DJ 15.605 (Project F-32-R).

MONITORING OF COASTAL FINFISH RESOURCES
FOR SPORT FISH MANAGEMENT
OCTOBER 1978-SEPTEMBER 1979

ABSTRACT

Gill nets, trammel nets and bag seines were utilized during October 1978-September 1979 in each of seven Texas bay systems (Galveston, Matagorda, San Antonio, Aransas and Corpus Christi Bays and the upper and lower Laguna Madre systems) to monitor the trends in relative abundance and size of the recreationally important saltwater fishes: red drum (Sciaenops ocellata), spotted seatrout (Cynoscion nebulosus), black drum (Pogonias cromis), sheepshead (Archosargus probatocephalus), southern flounder (Paralichthys lethostigma) and Atlantic croaker (Micropogon undulatus). During the same period the trends in relative availability and size of the six species in the East Matagorda Bay system were monitored utilizing gill nets only.

Except in Aransas and Corpus Christi Bays, the annual catch rates with gill nets of red drum, spotted seatrout and black drum were higher than those of sheepshead, southern flounder and Atlantic croaker within each bay system. Atlantic croaker were caught with the least regularity, regardless of month or bay system. The highest annual catch of spotted seatrout (0.62 fish/h) and black drum (0.84 fish/h) occurred in the lower Laguna Madre. The highest catch of red drum (0.85 fish/h) occurred in Matagorda Bay.

The individual meshes of the gill net were selective for species and size regardless of month or bay system. In each bay system, the 7.6- and 10.2-cm stretches meshes caught primarily red drum and spotted seatrout. Black drum and sheepshead were caught primarily in the 10.2- and 12.7-cm meshes. Catch rates of southern flounder were low in all mesh sizes and all bay system. Atlantic croaker were restricted almost exclusively to the 7.6-cm mesh.

Highest annual catch rates with trammel nets of red drum (2.82 fish/ha) and spotted seatrout (3.30 fish/ha) occurred in Matagorda Bay and the lower Laguna Madre, respectively. Annual catch rates of black drum were highest in Matagorda (5.38 fish/ha), Galveston (1.98 fish/ha) and Aransas Bays (1.79 fish/ha). Trammel net catches of sheepshead, southern flounder and Atlantic croaker either varied greatly or were too low to detect consistent monthly trends. Monthly changes in mean total lengths were apparent for red drum and spotted seatrout in all bay systems. No size variations were apparent for the other species in any bay system.

Annual catch rates with bag seines indicated variation in relative abundance among bay systems of juvenile red drum (4.89-29.66 fish/ha), spotted seatrout (1.56-48.83 fish/ha), black drum (1.90-37.04 fish/ha) and Atlantic croaker (2.78-466.20 fish/ha). Monthly catch rate and size patterns were apparent for red drum, spotted seatrout and Atlantic croaker. No apparent trends could be detected for catch rates and sizes of juvenile sheepshead and southern flounder.

INTRODUCTION

Finfish in Texas bays support important and valuable commercial and recreational industries. Commercial fishermen in the Texas bay systems (Galveston, Matagorda, San Antonio, Aransas, Corpus Christi Bays and Laguna Madre) reported landing 1,836,913 kg of fish during September 1977-August 1978 (McEachron 1980). During the same period recreational fishermen harvested an estimated 734,366 kg of fish from these same bay systems. Six species--spotted seatrout (Cynoscion nebulosus), red drum (Sciaenops ocellata), black drum (Pogonias cromis), sheepshead (Archosargus probatocephalus), southern flounder (Paralichthys lethostigma) and Atlantic croaker (Micropogon undulatus)--accounted for 95.0% of the total weight caught by commercial fishermen and 81.0% of the total weight caught by sport fishermen.

Estimates of the harvest and availability of the finfish resource are necessary in order to evaluate and implement management decisions effectively. Commercial harvest statistics have been collected by the Texas Parks and Wildlife Department (TPWD) since 1936. Collection of marine recreational harvest and pressure statistics were initiated by the Department in 1974 (Heffernan et al. (1976).

Fish availability and gear selectivity studies have been conducted periodically along the Texas coast since the late 1800's (Stevenson 1893). Information has been gathered on species diversities, relative abundances and life histories of the commercially and recreationally important fishes.

In November 1975 the Coastal Fisheries Branch of TPWD initiated a standardized program for gathering comparable information on the availability of the finfish resources in Texas bay systems. In addition to gathering baseline data, various gear types and techniques were evaluated from November 1975 to September 1977. In October 1977 an 8-mo study was funded by NOAA, NMFS under PL 88-309 (Project No. 2-313-R) to continue monitoring finfish resources with gill nets, trammel nets and bag seines for long-term fish availability trends.

In October 1978 the U. S. Department of Interior, USFWS approved a 5-yr program to continue monitoring trends in relative abundance and size of recreationally (and commercially) important saltwater fishes. This report is the summarization of the data collected during the first year.

AREA DESCRIPTION

The Texas Gulf coastline, extending from Sabine Pass to the mouth of the Rio Grande is approximately 595 km long (Diener 1975). Situated behind the barrier islands and peninsulas is a series of enclosed or semienclosed estuarine complexes (Figure 1).

Excluding Sabine Lake, the estuarine complexes of the Texas coast can be separated into eight physically and biologically distinct bay systems. These include Galveston, East Matagorda, Matagorda, San Antonio, Aransas and Corpus Christi Bay systems. The Laguna Madre can be considered as two distinct systems (upper and lower areas) due to the geographical barrier created by the "land cut" located approximately in the middle of the Laguna Madre.

Diener (1975) gave a comprehensive description of physical and biological

characteristics of the Texas coastal zone. Photocopies of the area descriptions from Matlock and Weaver (1979) are presented in Appendix A.

MATERIALS AND METHODS

Gill Nets

From October 1978 through September 1979 samples were collected with monofilament gill nets in the Galveston Bay, East Matagorda Bay, Matagorda Bay, San Antonio Bay, Aransas Bay, Corpus Christi Bay, upper Laguna Madre and lower Laguna Madre systems (Figures 2-10). One overnight set was made at four different stations each month in each bay system. Stations were randomly selected from a list of ≤ 100 sample stations compiled for each bay system (Appendix B). Each station on the list was at least 1.6 km of continuous shoreline from any other gill net station.

Two gill net sets were completed during the first two fullest weeks of each month and two additional sets were made during the last two fullest weeks of each month. Each sampling week extended from 1 h before sunset on Sunday through 1 h after sunrise the following Sunday.

Each gill net was set extending from the surface to the bottom and perpendicular to shore with the end with the smallest mesh on shore. Gill nets were set within 1 h before sunset and were raised within 1 h after the following sunrise. The total fishing time (to the nearest 0.1 h) was recorded.

Gill nets were 183 m long and 1.2 m deep with separate 46-m sections of 7.6-, 10.2-, 12.7- and 15.2-cm stretched monofilament meshes. Thread sizes were #277 (Nylon Net Company) for the 7.6- and 10.2-cm meshes, #6 for the 12.7-cm mesh and #7 for the 15.2-cm mesh. Webbing in each section was hung to both the float and lead lines on a one-half basis. One half basis indicates that a hung or finished gill net is one half the length of the amount (length) of stretched webbing before hanging. All four sections were tied together; 7.6-cm tied to 10.2-cm, 10.2-cm tied to 12.7-cm and 12.7-cm tied to 15.2-cm.

Each fish landed was identified to species (Parker 1972, Hoese and Moore 1977) and counted. The mesh size capturing each fish was noted. Total lengths (to the nearest mm) and wet weights (to the nearest 5 g) were obtained for the first 20 individuals of each species from each mesh size during each month.

Catch rates and fish sizes were determined on a monthly basis for red drum, black drum, spotted seatrout, sheepshead, southern flounder and Atlantic croaker caught in each mesh size and in the total net.

Monthly catch rates to the nearest 0.01 fish/h or kg/h were calculated for each species. Mean total lengths (mm) were calculated for each mesh size for each species for each month.

Trammel Nets

From October 1978 through September 1979 (except January and February 1979)

samples were collected with multifilament trammel nets in the Galveston Bay, Matagorda Bay, San Antonio Bay, Aransas Bay, Corpus Christi Bay, upper Laguna Madre and lower Laguna Madre systems (Figures 11-18). Twelve different sets were made each month in each bay system. Stations were randomly selected from a list of ≤ 100 sample stations compiled for each bay system (Appendix C). Each station on the list was at least 1.6 km of continuous shoreline from any other trammel net station.

Six trammel net sets were completed during the first two fullest weeks of each month and six additional sets were made during the last two fullest weeks of each month. Each sampling week extended from sunrise Monday through sunset the following Sunday.

Each trammel net was set to form a 1.67-ha rectangular area (91 m by 183 m) with the shoreline as one long side. The enclosed area was "struck" utilizing an outboard motor or walking techniques in order to create a disturbance thus scaring the enclosed fish into the net. Trammel nets were utilized only during daylight hours.

Trammel nets were 366 m long and 1.2 m deep with 30.5-cm stretched nylon multifilament (#15) mesh outer walls and 7.6-cm stretched nylon multifilament (#415) mesh inner walls. Webbing was colored with a combination of green and brown dyes.

Each fish landed was identified to species and counted. Total lengths and wet weights were obtained for the first 20 individuals of each species caught in each set during each month.

Abundances and fish sizes were determined on a monthly basis for red drum, black drum, spotted seatrout, sheepshead, southern flounder and Atlantic croaker.

Monthly abundance estimates, to the nearest 0.01 fish/ha or kg/ha, were calculated for each species. Mean total lengths (mm) were calculated for each species for each month.

Bag Seines

From October 1978 through September 1979 samples were taken with bag seines in the Galveston Bay, Matagorda Bay, San Antonio Bay, Aransas Bay, Corpus Christi Bay, upper Laguna Madre and lower Laguna Madre systems (Figures 19-26). Six different shoreline stations were sampled each month in each bay system. Stations were randomly selected from a list of ≤ 100 sample stations compiled for each bay system (Appendix D). Each station on the list was at least 1.6 km of continuous shoreline from any other bag seine station.

Three different stations were sampled with bag seines during each of the first two and last two fullest weeks of each month. Each sampling week extended from sunrise Monday through sunset of the following Sunday. If a preselected station was not sampled, an alternate randomly selected station was substituted. Stations were sampled only during daylight hours.

A bag seine sample was collected by pulling an extended seine parallel

to shore for a distance of no less than 15.2 m and no more than 30.5 m. The rectangular area sampled was estimated using the distance pulled and the length of extension of the bag seine.

Each bag seine was 18.3 m long and 1.8 m deep with 1.9-cm stretched nylon multifilament mesh in the lateral wings and 1.3-cm stretched nylon multifilament mesh in the central bag.

From each bag seine sample collected all fish were identified to species (Hoese and Moore 1977; Walls 1975; Gutierrez 1967; Hildebrand and Cable 1930, 1940; Pearson 1928) and counted. In addition, a random sample of no more than 20 individuals of each species was measured (total length).

General Procedures

The randomly selected stations for each gear type could not always be sampled as scheduled. If a preselected station could not be sampled, an alternate randomly selected station or an alternate day was substituted.

Fish data from each gear type were recorded on standard data forms. These data were key punched, placed on magnetic tape and summarized by computer at the Data Processing Section, TPWD, Austin.

Several hydrological parameters were measured at the time of the set and retrieval of each gill net sample and at the set of each trammel net and bag seine sample. Monthly means of salinity, water temperature, turbidity and dissolved oxygen are summarized in Appendix E.

RESULTS

Gill Nets

During October 1978-September 1979, 48 overnight gill net sets were successfully executed in each bay system. The annual mean catch rates (no/h) and mean total lengths (mm) for all meshes combined are summarized in Table 1.

Except in Aransas and Corpus Christi Bays the annual catch rates of red drum, spotted seatrout and black drum were equal to or higher than those of sheepshead, southern flounder and Atlantic croaker within each bay system (Table 1). In Aransas Bay, the catch rate of sheepshead (0.30 fish/h) exceeded that of spotted seatrout (0.24 fish/h). In Corpus Christi Bay the catch rate of sheepshead (0.31 fish/h) exceeded the catch rate of red drum (0.25 fish/h) and black drum (0.15 fish/h).

The monthly mean catch rates and mean total lengths by mesh size are summarized in Tables 2-49. The individual meshes of the gill net were generally selective for species and size regardless of month or bay system. In each bay system, the 7.6- and 10.2-cm stretched meshes caught primarily red drum and spotted seatrout. Black drum and sheepshead were caught primarily in the 10.2- and 12.7-cm meshes. Catch rates of southern flounder were generally low in all mesh sizes and all bay systems. Atlantic croaker catches were restricted almost exclusively to the 7.6-cm mesh.

Galveston Bay

Gill net catches of red drum ranged from 0.06 fish/h in April to 1.79 fish/h in December (Table 2). Mean lengths ranged from 313 mm in August to 559 mm in June. Smallest mean lengths occurred during July-September.

The highest spotted seatrout catch (0.54 fish/h) occurred in January (Table 3). No spotted seatrout were caught in June. Catches were highest in November, January and May. Mean length ranged from 362 mm in July to 665 mm in December.

The highest catches of black drum occurred during December (1.11 fish/h) (Table 4). No black drum were caught in February. Consistent catches (0.11-0.25 fish/h) were made during March-August. Mean total length ranged from 238 mm in May to 395 mm in October.

Sheepshead catches never exceeded 0.08 fish/h; mean total lengths never exceeded 360 mm (Table 5). No sheepshead were caught in January, March, April or August.

Southern flounder catches were lowest (0.02-0.04 fish/h) from November 1978 through July 1979 (Table 6). The highest catch (0.13 fish/h) occurred during October. Mean length ranged from 254 to 475 mm.

The highest catch (0.62 fish/h) of Atlantic croaker occurred in August (Table 7). No croaker were caught during December 1978-February 1979. No catches occurred in the 15.2-cm mesh section of the net. Mean length ranged from 253 to 296 mm.

East Matagorda Bay

Gill net catches of red drum ranged from 0.02 fish/h in March to 1.24 fish/h in December (Table 8). Mean length ranged from 308 mm in September to 637 mm in June. Smallest mean lengths occurred during July-September.

Spotted seatrout catches remained above 0.11 fish/h during the entire sample period (Table 9). The highest catch (1.12 fish/h) occurred in December. Mean total length ranged from 381 to 547 mm.

Lowest catches (0.12 fish/h) of black drum occurred during September 1979 (Table 10). The highest catch (1.45 fish/h) occurred during October 1978. Mean length ranged from 290 to 444 mm.

Highest catches of sheepshead, 0.25 and 0.19 fish/h, occurred during November and December, respectively (Table 11). No sheepshead were caught during July-September. Mean length ranged from 207 mm in June to 405 mm in February.

Southern flounder catches ranged from 0.02 to 0.20 fish/h (Table 12). Low catches (0.02-0.08 fish/h) occurred during December 1978-April 1979. Higher catches (0.13-0.20 fish/h) occurred during May-August. Mean length ranged from 188 to 408 mm.

Highest catches (0.41 fish/h) of Atlantic croaker occurred during September (Table 13). No croaker were caught in November, January, February or May.

Atlantic croaker were caught only in the 7.6-cm stretched mesh section of the net and ranged in length from 235 to 256 mm.

Matagorda Bay

Catches of red drum were highest (1.43-1.91 fish/h) during December 1978-February 1979 (Table 14). Lowest catches (0.13-0.19 fish/h) occurred during May-July. Mean length ranged from 331 mm in August to 492 mm in February.

The highest catches (0.98 fish/h) of spotted seatrout occurred during January (Table 15). High catches (0.28-0.98 fish/h) also occurred during October 1978-April 1979. Lowest catches (0.09-0.19 fish/h) occurred during May-July. Mean length ranged from 405 mm in October to 500 mm in June.

Black drum catches were high during December 1978 (1.91 fish/h) and January 1979 (1.93 fish/h) (Table 16). The lowest catches (0.18 fish/h) occurred during April. Mean length ranged from 195 mm during August to 534 mm during May.

Sheepshead catches never exceeded 0.16 fish/h (Table 17). No sheepshead were caught during February, June or July. Total length did not exceed 487 mm.

Southern flounder catches were highest during April (0.10 fish/h) and during June-August (0.11-0.15 fish/h) (Table 18). No flounder were caught during January or May. Mean length ranged from 230 mm in October to 390 mm in November.

Atlantic croaker were only caught during six months and only in the 7.6-cm mesh (Table 19). Highest catches occurred during October (0.32 fish/h) and September (0.26 fish/h). No croaker were caught during November 1978-April 1979. Mean length ranged from 235 to 281 mm.

San Antonio Bay

Gill net catches of red drum were highest during December (2.36 fish/h) and September (1.93 fish/h) (Table 20). Lowest catches (0.13-0.16 fish/h) occurred during February-March. Mean lengths were largest during January-June (424-454 mm) and smallest during August (298 mm).

Spotted seatrout catches ranged from 0.06 fish/h in June to 0.60 fish/h in November (Table 21). Mean length ranged from 361 mm in January to 471 mm in August.

Highest catches, 0.68 and 0.59 fish/h, of black drum occurred during December and January, respectively (Table 22). Lowest catches (0.02-0.08 fish/h) occurred during May-July. Mean length ranged from 281 mm in December to 637 mm in March.

No sheepshead were caught during December-February or during June (Table 23). Highest catches occurred during November (0.57 fish/h). Mean length ranged from 276 mm in July to 409 mm in August.

Highest catches (0.21 fish/h) of southern flounder occurred during October (Table 24). No flounder were caught during December 1978-January 1979. Catch rates during other months remained low (0.03-0.10 fish/h). Mean length ranged from 256 mm in November to 416 mm in May.

Atlantic croaker were caught only during October, July and August (Table 25). Mean length ranged from 260 to 273 mm.

Aransas Bay

Gill net catches of red drum were never <0.29 fish/h (Table 26). The highest catches (1.55 fish/h) occurred during November. Mean total length ranged from 358 to 482 mm.

No spotted seatrout were caught with gill nets during September (Table 27). Other catch rates ranged from 0.04 fish/h during October to 0.69 fish/h in April. Largest mean lengths (602 mm) occurred in December. Mean length increased from 394 mm in January to 520 mm in July.

The highest catches (0.97 fish/h) of black drum occurred during December and the lowest catches (0.12 fish/h) occurred during September (Table 28). Mean length ranged from 248 to 426 mm.

The highest catches (0.85 fish/h) of sheepshead occurred during July (Table 29). No sheepshead were caught during February. Other monthly mean catch rates ranged from 0.04 to 0.69 fish/h. Mean length ranged from 270 mm in August to 345 mm in June. No sheepshead were caught in the 7.6-cm mesh section of the net.

Catches of southern flounder never exceeded the 0.16 fish/h in November (Table 30). No flounder were caught during January. Consistently low catches (0.02-0.08 fish/h) occurred during the other months. Mean length ranged from 246 mm to 406 mm.

Although a high catch of 0.65 fish/h was recorded for Atlantic croaker during October, they were only caught during five months (Table 31). Mean length ranged from 206 to 326 mm.

Corpus Christi Bay

Gill net catches of red drum ranged from 0.08 fish/h during July to 0.47 fish/h during November (Table 32). Consistent catches (0.35-0.47 fish/h) occurred during October-December 1978. Mean length ranged from 327 mm in August to 549 mm in July.

Relatively high catches of spotted seatrout occurred during January-February (0.59-0.67 fish/h) and July-September (0.33-0.72 fish/h) (Table 33). The lowest catch rates (0.05 fish/h) occurred during March. Mean length ranged from 398 mm in November to 564 mm in January.

The lowest catches of black drum occurred during January (0.03 fish/h) while the highest catches (0.29 fish/h) occurred during August (Table 34). The mean length ranged from 310 to 453 mm.

Sheepshead catches ranged from 0.03 to 1.39 fish/h (Table 35). The mean length range was 312-378 mm.

Catch rates of southern flounder did not exceed 0.29 fish/h (Table 36). Mean length did not exceed 438 mm.

The highest catch rate of Atlantic croaker was 0.75 fish/h (Table 37). No croaker were caught during February or April. Consistent catches (0.10-0.25 fish/h) occurred during May-September. Mean length ranged from 233 to 296 mm. No croaker were caught in the 15.2-cm stretched mesh.

Upper Laguna Madre

Gill net catches of red drum never exceeded 0.30 fish/h (Table 38). Lowest catches (0.02 fish/h) occurred during January and July. Mean length ranged from 448 mm in February to 641 mm in January.

The highest catches (0.67 fish/h) of spotted seatrout occurred during October (Table 39). Consistent catches (0.34-0.57 fish/h) occurred during April-June. The lowest catch rates (0.02 fish/h) and the largest mean length (740 mm) occurred during January. Other monthly mean lengths ranged from 420 to 492 mm.

The highest catches (1.10 fish/h) of black drum occurred during October, followed by a general decline through January to 0.11 fish/h (Table 40). From February through September catch rates ranged from 0.11 to 0.41 fish/h. Mean length ranged from 338 mm in July to 470 mm in January.

The highest (0.34 fish/h) and the lowest (0.02 fish/h) catches of sheepshead occurred during December and January, respectively (Table 41). Mean length ranged from 356 mm in June to 418 mm in July. No sheepshead were caught in the 7.6-cm mesh.

Southern flounder catches never exceeded 0.13 fish/h (Table 42). Mean length ranged from 196 mm in February to 592 mm in September.

The catches of Atlantic croaker were somewhat erratic ranging from a high of 0.71 fish/h in October to 0.00 fish/h during November 1978-January 1979 and during March-April 1979 (Table 43). Mean length ranged from 260 to 330 mm.

Lower Laguna Madre

Gill net catches of red drum ranged from 0.10 fish/h during February to 1.04 fish/h during January (Table 44). There was a general decline in catch rate from March through August. Mean length ranged from 415 mm in September to 631 mm in February.

The catches of spotted seatrout ranged from 0.21 fish/h during February to 1.00 fish/h during July (Table 45). Mean length increased from 401 mm in October to 605 mm in February.

The lowest (0.12 fish/h) and highest (3.61 fish/h) catches of black drum occurred during June and July, respectively (Table 46). Mean length ranged from 373 mm in November to 486 mm in September.

The highest catches (0.29 fish/h) of sheepshead occurred during March-April (Table 47). The lowest catches (0.02 fish/h) occurred during October and May. The largest monthly mean total length was 412 mm.

Southern flounder catches ranged from 0.02 to 0.25 fish/h (Table 48). Mean length did not exceed 407 mm.

The lower Laguna Madre was the only system where Atlantic croaker were caught with gill nets each month (Table 49). The lowest catches (0.02 fish/h) occurred during October and February. The highest catches (0.69 fish/h) occurred during August. Maximum mean length was 379 mm.

Trammel Nets

During October 1978-September 1979, 120 trammel net strikes were successfully executed in each bay system. The annual mean catches (no/ha) and mean total lengths (mm) are summarized in Table 50.

Matagorda Bay had the highest annual mean catches of red drum (2.82 fish/ha), spotted seatrout (2.51 fish/ha), black drum (5.38 fish/ha) and southern flounder (0.58 fish/ha) (Table 50). The upper Laguna Madre had the lowest annual mean catches of red drum (0.44 fish/ha), spotted seatrout (0.89 fish/ha) and southern flounder (0.04 fish/ha).

Red drum catches with trammel nets in each bay system generally declined from October 1978 through March 1979, remained relatively low during April-July 1979 and increased during August or September (Tables 51-57). In all bay systems combined the monthly mean total lengths ranged from 291 to 537 mm, with slightly smaller fish being caught during October-November 1978 and August-September 1979 and larger fish being caught during the interim months.

Spotted seatrout catches in each bay system generally declined from October 1978 through March 1979 (Tables 58-64). Peak catches occurred during April-June 1979 in all bay systems except Galveston Bay which peaked in September 1979 (4.89 fish/ha) and the lower Laguna Madre which peaked in August 1979 (7.78 fish/ha). Substantial catches were recorded during September 1979 in all bay systems. The largest monthly mean total lengths coincided with periods of highest catches in most areas. Monthly mean lengths for all bay systems combined ranged from 368 to 574 mm.

Black drum catches with trammel nets generally remained below 1.00 fish/ha during October 1978-September 1979 in the San Antonio Bay, Corpus Christi Bay, upper Laguna Madre and lower Laguna Madre systems (Tables 65-71). In Galveston, Matagorda and Aransas Bays the highest monthly catches were 4.99, 15.92 and 4.39 fish/ha, respectively. Black drum ranged in mean total length from 223 to 431 mm in all bay systems combined.

Trammel net catches of sheepshead generally remained below 1.00 fish/ha in all bay systems except the lower Laguna Madre (Tables 72-78). Catch rates in the lower Laguna Madre were > 1.00 fish/ha from March through September 1979. Monthly catches in Galveston Bay, Corpus Christi Bay and the upper Laguna Madre remained low (0.00-0.85 fish/ha) while catches in Matagorda, San Antonio and Aransas Bays fluctuated considerably (0.05-3.04). Mean total lengths ranged from 194 mm in Corpus Christi Bay to 465 mm in the upper Laguna Madre.

Southern flounder catches with trammel nets in all bay systems were too low to detect any monthly trends (Tables 79-85). In all bay systems mean monthly catches were < 0.75 fish/ha except in Matagorda Bay (maximum 1.70 fish/ha during September 1979), San Antonio Bay (maximum 1.05 fish/ha during July 1979)

and the lower Laguna Madre (maximum 1.00 fish/ha during July 1979). Monthly mean lengths of southern flounder ranged between 160 and 417 mm with no monthly patterns discernible.

The highest catches of Atlantic croaker occurred during May-September 1979 in all bay systems except the upper Laguna Madre (Tables 86-92). The highest catches in the upper Laguna Madre occurred during October 1978 followed by consistent catches during May-September 1979. Coastwide, mean lengths ranged from 197 mm in Matagorda Bay in June to 335 mm in Corpus Christi Bay in November.

Bag Seines

During October 1978-September 1979, 72 bag seine samples were collected in each bay system. The annual mean catches (no/ha) and mean total lengths are summarized in Table 93.

Galveston Bay had the highest annual mean catches of spotted seatrout (38.43 fish/ha), black drum (37.04 fish/ha), sheepshead (15.74 fish/ha) and Atlantic croaker (466.20 fish/ha). (Table 93). The lower Laguna Madre had the highest catches of red drum (29.66 fish/ha). No southern flounder were caught with bag seines in Aransas Bay during the sampling period.

Bag seines caught red drum in each bay system during at least five months between October 1978 and July 1979 (Table 94). The largest red drum catches occurred between November 1978 and March 1979 in all bay systems. Peak catches ranged from 16.67 fish/ha in December in Aransas Bay to 145.83 fish/ha in February in the upper Laguna Madre. Monthly mean length ranged from 20 mm in the lower Laguna to 284 mm in Matagorda Bay. Overall mean total lengths were similar in all bay systems, as was the apparent increase in size from October 1978 through September 1979.

Catches of spotted seatrout were generally highest during October-November 1978 and August-September 1979 in all bay systems (Table 95). The highest catches (366.67 fish/ha) occurred during September 1979 in Galveston Bay. No spotted seatrout were caught during March-April 1979 in any bay system. Generally, the smallest fish were caught during the months of greatest catches. Monthly mean length ranged from 32 to 360 mm.

Bag seine catches of black drum were highest in each bay system during June-July 1979 except in the upper Laguna Madre (Table 96). Peak catches ranged from 7.14 fish/ha in Aransas Bay to 277.78 fish/ha in Galveston Bay. No black drum were caught during January-March 1979. Mean length ranged from 33 to 299 mm with consistently larger fish caught during October-December 1978 and smaller fish caught during May-July 1979.

Catches of sheepshead ranged from 0.00 to 142.86 fish/ha (Table 97). Mean length ranged from 29 to 378 mm. No apparent trends in monthly catches or length were detected.

Bag seine catches of southern flounder never exceeded 16.67 fish/ha and were predominantly 0.00 fish/ha in all bay systems (Table 98). Mean length ranged from 38 to 410 mm.

Atlantic croaker were caught primarily during February-May 1979 in all bay systems (Table 99). Catches did not exceed 777.78 fish/ha in any bay system or in any month except during March 1979 in Galveston (3233.34 fish/ha) and the lower Laguna Madre (2366.67 fish/ha). Mean length (range: 18-200 mm) generally increased from January through September 1979.

DISCUSSION

During October 1978-September 1979 gill nets, trammel nets and bag seines were used to monitor the relative availability, abundance and sizes of red drum, black drum, spotted seatrout, sheepshead, southern flounder and Atlantic croaker in Texas bay systems.

The inherent differences among each gear type may contribute to variable catches for similar species within the same bay system. Gill nets are considered to be a "passive" gear (Matlock and Weaver 1979). Catches with gill nets are dependent upon the natural movement of fishes. Trammel nets could be classified as "semi-passive", catches being dependent on induced fish movement. Bag seines are an "active" gear type; movement of the net is required in order to catch fish.

Webbing material and twine size of gill nets can affect the species caught as well as the catch rates (Hamley 1975, Pristas and Trent 1977). Monofilament webbing and smaller twine size usually achieve higher catch rates for small spotted seatrout and red drum. Pristas and Trent (1977) found that multifilament gill nets caught certain species such as sea catfish and gafftopsail catfish at significantly greater rates. This may hold true for multifilament trammel nets.

Gill nets set at night have significantly greater catches than day sets (Pristas and Trent 1977). TPWD experimental gill nets are set from sunset to sunrise. Trammel nets and bag seines are only utilized during daylight hours. Determinations need to be made on the optimum daylight hours for working these nets and/or the practicality of striking trammel nets or pulling bag seines at night.

Availability and relative abundance may be directly affected by mesh size selectivity. Trammel nets catch fish over a wide size range; therefore, they are considered to be less selective than single walled gill nets (Rounsefell 1975). Size selectivity was reported for TPWD experimental gill nets during 1975-1978 (Matlock and Weaver 1979) and during the current study. Fish size and body configuration also directly affect the selectivity of a net (Hamley 1975). This may contribute to the low catches of sheepshead and southern flounder with both gill nets and trammel nets.

Appendix A. Bay systems area descriptions.

AREA DESCRIPTIONS

Galveston Bay

The Galveston Bay system, which includes 353,768 acres, is the largest estuary on the Texas coast (Fisher et al. 1972) and consists of Galveston,

Trinity, East, West, Dickinson, Chocolate, Christmas, Bastrop, Dollar, Drum and Tabbs Bays and Clear, Moses and Jones Lakes (Fig. 1a-b).

The estuary is separated from the Gulf of Mexico by Bolivar Peninsula, Galveston Island and Follets Island. Two natural passes, Bolivar Roads and San Luis Pass, and one man-made pass, Rollover Pass, connect the estuary with the Gulf.

Bay depths average 6.9 ft or less except in dredged channels. Bolivar Roads, Houston, Texas City, Galveston and Bayport Ship Channels are dredged to 40 ft. The Intracoastal Waterway is dredged to 12.1 ft through East, lower Galveston, and West Bays (Diener 1975).

Bay substrates include mud, shell and clay; barrier island shorelines are predominately sand. Approximately 7,527 acres of oyster reefs lie in Galveston, Trinity, East, West and Dickinson Bays (Benefield and Hofstetter 1976). Numerous spoil "islands" occur along most dredged channels.

Shoreline marshes are present along portions of East, West, Trinity, Christimas, Bastrop, Drum and Chocolate Bays. Diener (1975) listed 231,342 acres of emergent vegetation--smooth cordgrass (Spartina alterniflora), salt meadow cordgrass (S. patens), bulrush (Scirpus olneyi), shoregrass (Monothochloe littoralis), rush (Juncus romerianus), seashore saltgrass (Distichlis spicata) and saltwort (Batis maritima)--and 18,095 acres of submergent seagrasses--widgeon grass (Ruppia maritima) and Holodule beaudettei--in Galveston Bay. McEachron, Shaw and Moffett (1977) reported Halophila engelmanni and turtle grass (Thalassia testudinum) in Christmas and Bastrop Bays.

The bay receives an average 2642 billion gal of fresh water annually, 90% of which comes from the Trinity and San Jacinto Rivers (Environmental Protection Agency 1971). Diener (1975) reported salinities ranging from 5-15 o/oo in Trinity and upper Galveston Bays to 20-30 o/oo in the lower portions of Galveston Bay near the Gulf. From November 1975 through March 1976 bay salinities at gill net stations ranged from 2.2 to 28.9 o/oo, dissolved oxygen varied from 5 to 18 ppm and water temperatures ranged from 40.1 to 76.1 F (Texas Parks & Wildlife Dept., Seabrook, Texas).

The Galveston Bay complex is adjacent to the most populated and industrialized area of Texas. A population of 2,424,800 people reside in the eight counties bordering the bay (1974 Census Data, Houston--Galveston Area Council, personal communication). The highest concentrations of people and industrial complexes are on the western shores of Galveston Bay and the eastern shores of West Bay. From 1967 to 1969 the daily average flow of domestic wastewater into the Galveston Bay complex was at least 16.7 million gal and the industrial wastewater inflow at least 300 million gal (Diener 1975).

Sport fishermen caught an estimated 2,774,297 lb of fish in the bay from September 1974 through August 1975 (Heffernan et al. 1977). The commercial fishing industry harvested over 45.1 million lb of shrimp worth \$38,000,000, 15.4 million lb of blue crabs worth \$1,700,000, 6.6 million lb of finfish worth \$1,200,000, 21.4 million lb of shelled oysters worth \$11,700,000 and 9.3 million lb of small bait shrimp worth \$11,100,000 (O. B. Lynam, Texas Parks & Wildlife Dept., Seabrook, Texas, Unpublished data).

East Matagorda Bay

East Matagorda Bay (Fig. 2) is a relatively shallow (3.4 ft average depth), medium to high salinity (15-30 o/oo), turbid bay with a surface area of 37,810 acres at mean low water (MLW) (Diener 1975).

The bay's only connection with the Gulf of Mexico has historically been Brown Cedar Cut at the east end. Caney Creek and the Colorado River delta mark the northeast and southwest boundaries, respectively. The Matagorda Peninsula forms the southern boundary while the Intracoastal Waterway borders the northern shoreline of East Matagorda Bay.

Extensive stands of emergent cordgrass (Spartina sp.) occur along both the southern and northern boundaries with rush found on the northern shoreline. Submergent grasses include widgeon grass and Halodule beaudettei.

Oyster reefs are located throughout the system but no estimate of the acreage was available.

East Matagorda Bay receives fresh water from rainfall and runoff entering the Intracoastal Waterway from Caney Creek, the Colorado River and Peyton Creek (via Lake Austin and Live Oak Bayou). No estimates of the amount of annual fresh water inflow were available.

Population centers are located at each end of the bay in Matagorda (population 700) and in Sargent (population unknown). Fishing comprises the major activity of residents in both towns; however, information concerning commercial and recreational landings has been combined with data from the Matagorda Bay system.

Matagorda Bay

The Matagorda Bay system (Fig. 3) encompasses an area of 244,430 acres and has an average depth of about 6.9 ft at MLW (Diener 1975). It includes Tres Palacios, Turtle, Garancahua, Lavaca, Cox, Keller and Chocolate Bays and Oyster, Redfish, Salt and Powderhorn Lakes.

Matagorda Bay is a large primary bay of 167,529 acres and 7.9 ft mean depth (Diener 1975). The southern boundary is the long, narrow Matagorda Peninsula with sand shoreline and extensive areas of submergent and emergent grasses; the eastern confine is the Colorado River delta and the western boundary is a shallow sand shoreline with limited submergent and emergent vegetation. The community of Port O'Connor (population 1,400) is in the southwest corner. Several secondary and tertiary bays associated with major and minor drainages into Matagorda Bay indent the northern perimeter.

Oyster Lake is a shallow muddy tertiary system of 2335 acres and 2.6 ft mean depth (Diener 1975) located along the northwestern shoreline of Matagorda Bay. Numerous oyster reefs are located throughout the system and the periphery is surrounded by emergent vegetation. Tres Palacios Bay is a secondary system of 9436 acres and 3.9 ft mean depth (Diener 1975) with oyster reefs and scattered shell throughout. The community of Palacios (3,500 people) is located on the northern shoreline. Turtle Bay, with 1280 acres and 2.6 ft mean depth (Diener 1975), is a muddy system with a moderate number of oyster reefs. The

shoreline is primarily clay bluffs with scattered emergent vegetation communities.

Carancahua Bay, along the north central shoreline of Matagorda Bay, covers 13,076 acres and has a 3.9-ft mean depth (Diener 1975). Several resort communities (Port Alto, Schicke Point and Cape Carancahua) are located along the bay. This bay has little marsh except in the southern portion where the tertiary systems of Redfish and Salt Lakes are located. Steep banks and sandy clay constitute the majority of the shore areas.

Lavaca Bay is a large secondary bay in the northwest corner of Matagorda Bay with 44,729 acres and 4.3-ft mean depth (Diener 1975). The shoreline is primarily clay bluffs. On the southeastern shoreline of Lavaca Bay are two smaller secondary areas: Cox Bay and Keller Bay. Cox Bay is a shallow muddy system with a clay bluff periphery and scattered oyster reefs throughout. Keller Bay is a deeper system and the southern perimeter has the largest submerged grass beds found in the Lavaca Bay complex. The community of Olivia (240 people) is located at the head of Keller Bay. On the western shoreline of Lavaca Bay is Chocolate Bay, a small, muddy bay of 699 acres and 2.6-ft mean depth with clay bank shoreline (Diener 1975). North of Chocolate Bay is the city of Port Lavaca (12,000 people). The area of central Lavaca Bay is the most heavily industrialized in the Matagorda Bay system.

South of Lavaca Bay, on the western shoreline of Matagorda Bay, is Powderhorn Lake. This is a moderately saline, shallow body of water of 2889 acres and 2.3-ft mean depth (Diener 1975). This "lake" connects with Matagorda Bay through Powderhorn Bayou on which the community of Indianola (200 people) is located. The periphery of this bay is surrounded by large emergent grass communities.

There are two direct exchanges with the Gulf of Mexico, Pass Cavallo and the Matagorda Ship Channel, both located in the southwest corner of Matagorda Bay, and one indirect connection, the Colorado River, on the eastern boundary. The western portion of Matagorda Bay and the southern two-thirds of Lavaca Bay are transected by the Matagorda Ship Channel, 35.4 ft deep (Diener 1975), with associated spoil banks. The channel originates at the ALCOA (Aluminum Company of America) plant on the eastern shoreline of Lavaca Bay and terminates at the Gulf of Mexico through the Matagorda jetties. Small channels branch off in Lavaca Bay to the Refuge Harbor at Port Lavaca and to the Lavaca River. The Intracoastal Waterway, dredged to 12.1 ft (Diener 1975), intersects the Matagorda Ship Channel near Port O'Connor. The Palacios Ship Channel branches from the Intracoastal Waterway in south central Matagorda Bay.

Diener (1975) listed 119,970 acres of emergent vegetation--smooth cordgrass, salt meadow cordgrass, saltwort, shoregrass and coastal dropseed (Sporobolus virginicus)--and 7037 acres of submergent vegetation (widgeon grass and Halodule beaudettei) in the Matagorda Bay system.

Between 1957 and 1968 Matagorda Bay received an average 713 billion gal of freshwater discharge annually (Diener 1975), mainly through the Tres Palacios, Carancahua, Lavaca and Navidad Rivers with partial flow entering the bay from the Colorado River. From November 1975 through March 1976, bay water salinities at gill net stations ranged from 10.0 to 28.0 o/oo, dissolved oxygen varied from 6.0 to 13.0 ppm and water temperatures ranged from 44.6 to 78.8 F (Texas Parks & Wildlife Dept., Palacios).

Sport fishermen caught an estimated 844,600 fish weighing 968,832 lb in Matagorda Bay from September 1975 through August 1976; during the same period commercial fishermen landed 176,370 lb of fish (Breuer et al. 1977).

San Antonio Bay

The San Antonio Bay system consists of the primary bays San Antonio and Espiritu Santo and the secondary bays Hynes, Guadalupe and Shoalwater (Fig. 4). Several large natural saltwater lakes occur along Matagorda Island and connect with the primary bays via sloughs and small passes. Two major passes, Cedar Bayou Pass to the west and Pass Cavallo to the east, provide circulation routes between the Gulf of Mexico and the bay system.

San Antonio, Hynes and Guadalupe Bays cover approximately 84,012 acres and Espiritu Santo Bay covers 34,099 acres for a total bay system area of 118,111 acres (Collier and Hedgpeth 1950). The average depths of the unaltered bay system are 3.9 ft in San Antonio Bay (maximum of 7.6 ft) and 4.9 ft in Espiritu Santo Bay (maximum of 7.9 ft) (Collier and Hedgpeth 1950).

Bottom substrates are generally silty clay and sand in the upper bay region which gradually change to sand clay and sand in the lower bay and Espiritu Santo bay regions (Texas Parks & Wildlife 1975). Approximately 3015 acres of spoil islands and 2001 acres of oyster reefs occur in the bay system (Burg 1974). One of the major oyster reefs is Panther Reef which extends from Panther Point north toward Mosquito Point.

The Guadalupe and San Antonio Rivers are the major sources of fresh water for the San Antonio Bay system, providing an average annual inflow of 449 billion gal from a drainage area of 6,559,920 acres (Childress et al. 1975). The amount of fresh water entering the system generally depends upon rainfall in the upland drainage rather than on local drainage. Local rainy periods usually occur during early summer and fall. The average annual rainfall for the area is 33.9 inches (Texas Parks & Wildlife 1975).

Salinity values for the bay system generally increase as the distance from the rivers increases. Out-flowing fresh water moves along the west shore of San Antonio Bay while incoming Gulf water moves along the east shore (Childress et al. 1975). Average surface salinities range from 0.0 o/oo in Guadalupe Bay to about 8.0 o/oo in lower San Antonio Bay and from 14.0 to 21.0 o/oo in Espiritu Santo Bay (Childress et al. 1975). No seasonal turbidity patterns are noted within the bay system; however, turbidities tend to increase toward the upper bay and river-influenced areas, as well as in areas disturbed by mud-shell and channel dredging operations (Childress et al. 1975). Dissolved oxygen concentrations increase during cold months and decrease during warm months. Between May 1972 and August 1973, average dissolved oxygen concentrations ranged from 7.0 to 12.4 ppm (Childress et al. 1975).

About 24,993 acres of emergent and 16,345 acres of submergent vegetation are found in the San Antonio Bay system (Diener 1975). Smooth cordgrass is the dominant emergent plant in all areas of the bay system except in upper San Antonio Bay where common reed, Phragmites communis, is dominant (Childress et al. 1975). Other species of emergent vegetation include saltwort, saltgrass, shoregrass and salt meadow cordgrass (Diener 1975). The dominant submergent vegetation of the San Antonio Bay system is shoal grass, Diplanthera wrightii.

This plant is located primarily in the low turbidity areas of lower San Antonio Bay and Espiritu Santo Bay and in the shallow lakes and sloughs found along the northern margin of Matagorda Island. Other species of submergent vegetation found in the bay system include widgeon grass, and the algae Polysiphonia gorgoniae, Spyridia filamentosa, Gracilaria folifera, Ulva lactuca and U. fasciata (Childress et al. 1975). The algae are usually found attached to submerged solid objects such as oyster shells or pilings. However, some algae can be found in calm areas attached to mud or sand substrates.

Four small towns occur on the shoreline of the San Antonio Bay system: Austwell, Long Mott, Seadrift and Port O'Connor. Less than 4,000 inhabitants live in these four communities combined (1970 census). The primary businesses found in this area are farming, ranching and fishing, including shrimping and oystering. The majority of the bay shoreline as well as the San Antonio-Guadalupe River drainage occurs on or near ranchland and farmland. Two major industries exist on the San Antonio Bay system; Union Carbide Corporation at Long Mott and DuPont de Nemours E.I. & Company at Bloomington, a town on the Guadalupe River approximately 20 miles from the bay.

The tourist industry is not very extensive, but a few fishing centers at Seadrift and Port O'Connor furnish tackle, guides and access to the bay system. Most of the sport fishing occurs in Espiritu Santo Bay. Between September 1974 and August 1975, sport fishermen harvested an estimated 416,453 lb of fish from the entire bay system; commercial fishermen harvested an estimated 482,592 lb of fish (Heffernan et al. 1977). In addition, approximately 883,172 lb of shrimp, 1,125,239 lb of blue crabs and 196,873 lb of oysters were harvested commercially during the 1974 calendar year (O. B. Lynam, Texas Parks & Wildlife Dept., Seabrook Field Station, personal communication).

Aransas Bay

The Aransas Bay complex consists of primary, secondary and tertiary bays. The system extends from Aransas Pass, Texas, northeastward to Mesquite Bay, and from its eastern boundary of San Jose Island, westward across Copano Bay to the small community of Bayside, Texas (Fig. 5).

Aransas Bay is the primary bay with a surface area at MLW of 56,207 acres and an average depth of 7.9 ft (Diener 1975). A direct water circulation and marine life migration route from the Gulf of Mexico to the bay is provided by a deep water (45.0-46.9 ft) pass, 600 to 712 ft in width, between San Jose Island and Mustang Island at Port Aransas, Texas (Anonymous 1971). This accounts for the higher than average salinities in the southern region of the bay (approximately 30 o/oo). The middle of the bay is the deepest part with a maximum value of 13.1 ft at MLW (U. S. Dept. Commerce 1976a). Six major oyster (Crassostrea virginica) reefs ranging in area from 25 to 257 acres are concentrated in the northern portion of Aransas Bay, along with scattered smaller reefs (Heffernan 1961). There are no private oyster leases in the Aransas Bay system (Diener 1975).

Copano, St. Charles, Redfish and Dunham Bays are considerably shallower, secondary areas, supporting extensive growths of algae and "grasses", which provide valuable nursery grounds for juvenile fish and crustaceans (Heffernan 1972a). Nutrient circulation in these bays is generally affected by freshwater runoff as well as by tidal fluctuations.

Copano Bay is the largest secondary bay with 41,730 acres of surface water and an average depth of 3.6 ft with a maximum depth of 8.9 ft (Diener 1975). The Mission and Aransas Rivers flow into the bay with respective discharges of 733.3 and 65.0 gal/s (Diener 1975).

Copano Bay has five large oyster reefs, ranging in size from 22 to 42 acres, plus a compliment of smaller reefs (Heffernan 1961). The transverse position of a few of the reefs near the mouth of Copano Bay dampen tidal action in much of the bay (Collier and Hedgpeth (1950).

The narrow St. Charles Bay, extending between Lamar Peninsula and the Aransas National Wildlife Refuge, has a surface area of 8408 acres with a 3.6-ft average depth (Diener 1975). Freshwater flow from five creeks enters the bay along its northern reaches. Nearly the entire bay is considered prime nursery ground (Heffernan 1972a).

Redfish and Dunham Bays, at the southern and northern ends, respectively, of Aransas Bay, are also very shallow nursery areas but these bays do not receive direct freshwater flow. Redfish Bay is densely vegetated while Dunham Bay is a muddy, sparsely vegetated area.

Tertiary nursery grounds are located principally in the lower regions of creeks and streams which enter the secondary bays. Port Bay with 1651 acres extends southward from Copano Bay and receives freshwater from creek drainage at its southern tip (Diener 1975).

Mission Bay and lower Mission River with nearly 3939 acres and located off the northwest shore of Copano Bay are the most valuable nursery grounds of the tertiary areas (Heffernan 1972b).

Copano Creek harbors a small portion of nursery grounds in the northwest corner of Copano Bay (Heffernan 1972a).

Tertiary regions of Chiltipin Creek and the Aransas River system are located along the western shore of Copano Bay (Heffernan 1972a).

The Aransas Bay system contains 137,514 acres of water (Heffernan 1972a) of which 44,989 acres are occupied by eight major species of emergent vegetation--saltwort, shoregrass, glassworts (Salicornia sp.), smooth cordgrass, salt meadow cordgrass, coastal dropseed, sea purselane (Sesurium portulacastrum) and seashore saltgrass--and 4,124 acres by three major species of submerged vegetation--(Halodule beaudettei), widgeon grass and turtle grass (Diener 1975; W. E. Mercer, TPWD, Personal Communication).

The climate of this area varies from semi-arid to dry sub-humid. Southeast winds are dominant most of the year but from December through February northerly winds associated with advancing cold fronts are common (Whitehouse and Williams 1953). Winters in the Aransas Bay system produce the lowest average monthly water temperatures (59.2 F) and rainfall (0.8 inch). Water temperatures increase through the spring (70.9 F), reach the highest values in the summer (83.7 F) and decline through the fall (73.6 F). Rainfall is greatest in the fall (6.4 inches). The amounts of rainfall in spring and summer average about 2.6 inches. Salinity values are inversely related to rainfall with the lowest salinity (14.1 o/oo) occurring in the fall. The highest salinity occurs in spring (26.8 o/oo). Dissolved oxygen, pH and

turbidity remain relatively constant throughout the year with average values of about 7.0 ppm, 8 and 50 Jackson Turmidity Units (JTU), respectively (Martinez 1970, 1971).

Water movement in the bay system is strongly influenced by wind action. Generally, however, the surface waters take a serpentine course, flowing during a falling tide from Copano Strait south toward Mud Island where there is a clockwise eddy which tends to return the bay water northward along the face of the more saline water from below Mud Island. On a strong rising tide this water is pushed east so that the eddy constricts into an ellipse (Collier and Hedgpeth 1950). The average tidal range for Aransas Bay is 0.49 ft (Diener 1975).

Mud is the predominant bottom sediment of the Aransas Bay system except along the sandy western shore of San Jose Island (Diener 1975).

The average total weight of finfish caught per year by commercial fishermen in the Aransas Bay system during the period 1969-1971 was 573,612 lb (Martinez 1970, 1971). The annual average harvest of commercially caught shrimp and crabs during the same period was 816,991 lb and 420,827 lb respectively.

Along the 230 miles of shoreline of the Aransas Bay system, the only communities of notable size are Lamar, Bayside, Fulton, Rockport and, the largest, Aransas Pass which has a population of about 6,000.

There are three domestic but no industrial waste outfalls in the bay system. Previous high discharges of toxic oilfield brine into Chiltipin Creek and the Mission River were ordered ceased in 1973 by the Texas Railroad Commission (Heffernan 1972b). A total of 14,796 acres in the Aransas Bay system are now closed to shellfishing by the Texas Board of Health (Diener 1975) because of domestic sewage problems.

Corpus Christi Bay

The Corpus Christi Bay system, composed of Corpus Christi, Nueces, lower Redfish and Oso Bays, is located on the lower third of the Texas Gulf coast between longitude 97° 02' and 97° 32' W and latitude 27° 41' and 27° 55' N (Fig. 6). It is bordered on the northeast by upper Redfish Bay, on the east by Mustang Island and on the south by the upper Laguna Madre. The city of Corpus Christi forms the western boundary of Corpus Christi Bay. Nueces Bay, the former coastal lagoon for the Nueces River basin, is positioned on an east-west axis, entering Corpus Christi Bay at the northwest corner, just north of Corpus Christi. The southern half of Redfish Bay separates Aransas from Corpus Christi Bay and enters Corpus Christi Bay in the northeast quadrant. Oso Bay, the semi-enclosed drainage area for Oso Creek, joins Corpus Christi Bay in the southwest quadrant.

The entire Corpus Christi Bay system has an area of 124,796 acres with 127 miles of shoreline. Corpus Christi Bay is the largest of the four bays in the system, having a total surface area of 95,997 acres. Nueces Bay has an area of 19,518 acres, Oso Bay covers approximately 17,095 acres and lower Redfish Bay covers approximately 5258 acres. The average depth of Corpus Christi Bay is 11.2 ft; Nueces, Oso and lower Redfish Bays average 2.0 ft in depth (Collier and Hedgpeth 1950, Hood 1953, Stevens 1959).

Sediment composition in Corpus Christi Bay ranges from fine sand to black mud. A mixture of gray clay and black mud is the dominant bottom type for the area. Brown silt occurs in areas of channelization while hard sand and fine shell can be found adjacent to Mustang Island.

Submergent vegetation is sparse in Corpus Christi Bay, except along its eastern shore where shoal grass and widgeon grass dominate. Emergent vegetation, found throughout the bay complex, consists primarily of saltwort, glassworts, shoregrass, smooth cordgrass, coastal dropseed, seablite, Suaeda linearis, sea oats, Uniola paniculata and saltmarsh bullrush, Scirpus maritimus. In Corpus Christi Bay, 19 oyster reefs total 563 acres and are confined primarily to the western and northern portions. Oysters occur throughout Nueces Bay (Stevens 1959, 1960; Diener 1975). The primary sources of freshwater inflow into the Corpus Christi Bay system are Oso Creek and the Nueces River. Prior to the construction of Wesley Seale Dam at Mathis, Texas, in 1958, the Nueces River averaged 20 billion gal of discharge per year. The reservoir furnishes the industrial and municipal freshwater needs for the city of Corpus Christi and surrounding towns. Freshwater inflow to Nueces and Corpus Christi Bays is now limited to periods of dam overflow and heavy land runoffs (Stevens 1959).

Prior to 1972, the primary source for water exchange between Corpus Christi Bay and the Gulf of Mexico was the Corpus Christi Channel. This ship channel extends approximately 18 miles from the Port of Corpus Christi to its intersection with the Aransas Ship Channel, which continues for approximately 1 mile to the Gulf of Mexico. The two channels are maintained at an average depth of 40.0 ft (U. S. Dept. Commerce 1974). Since its completion in 1972, the Corpus Christi Fish Pass has provided intermittent water exchange through the upper Laguna Madre, but in recent years this has only occurred in association with hurricane winds and tides. Water exchange for Corpus Christi Bay with lower Redfish Bay and the upper Laguna Madre takes place primarily through the Intracoastal Waterway and on a limited basis across the shallow flats during high tides.

The climate for the area is intermediate between the semi-arid regions to the west and southwest and the humid subtropical region to the northeast. For the period 1936-1975 the mean annual air temperature was 71.2 F and the mean annual rainfall was 28.5 inches (NOAA 1975).

The general water circulation pattern for the Corpus Christi Bay system is a counterclockwise movement along the shoreline (Stevens 1959). The predominant winds, generally from the southeast year-round with occasional "northerns" in the winter, and the irregular lunar tides, have the greatest overall influence on the bay water movement. For the period 1968-1972, the mean salinity and the mean water temperature for the entire Corpus Christi Bay system was 26.1 o/oo and 73.4 F, respectively (Martinez 1968, 1969, 1970, 1971 and 1972). The mean turbidity for the same period was 43 JTU, although the mean for Nueces Bay during 1971 and 1972 was 107 JTU.

The entire system lies within Nueces County, Texas. The county, with an area of 536,301 acres, had a population of 237,544 persons as of the 1970 census. The City of Corpus Christi had a population estimate of 204,525 (Diener 1975). Extensive oil and gas exploration has resulted in numerous well platforms and submerged pipelines throughout Nueces and lower Redfish Bays and along the western shore of Corpus Christi Bay. Heavy industrialization

has occurred along the south shore of Nueces Bay and the north shore of Corpus Christi Bay in the area of La Quinta Channel.

Upper Laguna Madre

Located on the lower Texas coast between latitudes $27^{\circ} 10'$ and $27^{\circ} 41'$ the upper Laguna Madre system consists of the upper Laguna Madre and the Baffin Bay system (Fig. 7). The upper Laguna Madre is a long (approximately 41 miles), narrow (9.8 miles) and shallow (average depth 3.3 ft) lagoon extending from the Kenedy Land Cut to Corpus Christi Bay (Simmons 1957; Diener 1975; U. S. Dept. Commerce 1976b). Bordered on the east by Padre Island and on the west by the city of Corpus Christi and the King and Kenedy Ranches, the upper Laguna Madre covers approximately 47,228 acres at MLW (Diener 1975).

This long, narrow coastal lagoon is bisected imperfectly by the Intra-coastal Waterway, which is 124.7 ft wide and 12.1 ft deep. Spoil banks from this canal form a dike 13 miles long effectively dividing the northern part of the bay. Beyond this point, spoil banks are staggered and the division is less effective (Simmons 1957). The northern end of the lagoon is restricted by a land fill causeway which has three openings totaling about 899 ft in width at MLW. The southern end is restricted by a land fill through which the Intra-coastal Waterway extends.

The upper Laguna Madre is joined in the southern portion by the equally large Baffin Bay system--consisting of Baffin Bay, Alazan Bay, Laguna Salada, Cayo del Grullo and Cayo del Infernillo--which covers an estimated 54,117 acres. Baffin Bay, the central and largest bay of the group, is a narrow body of water, 19 miles long and 5 miles wide, bisected laterally by the demarcation line of Kleberg-Kenedy Counties (Breuer 1957). The average depth in Baffin Bay is 7.9 ft at MLW, with a maximum depth (MLW) of 12.1 ft near the entrance to the Laguna Madre (Breuer 1957, Diener 1975). There are approximately 31,861 acres of surface area (MLW) in Baffin Bay.

Alazan Bay, entirely within Kleberg County and the King Ranch, extends approximately 15 miles northeasterly to the mouth of Petronilla Creek (Breuer 1957, Diener 1975). The average water depth (MLW) in Alazan Bay is approximately 3.0 ft. The surface area of Alazan Bay is approximately 13,867 acres.

Cayo del Infernillo is a shallow slough (0.7 ft) extending westward from the west shore of Alazan Bay whose water surface at MLW covers 699 acres (Breuer 1957, Diener 1975).

Baffin Bay is joined by two small tertiary bays--Laguna Salada entering from the west and Cayo del Grullo from the northwest. Both bays have an average water depth (MLW) of 3.0 ft. Laguna Salada covers approximately 3227 acres and Cayo del Grullo about 4470 acres.

The upper Laguna Madre, with restricted openings at either end, no constant openings into the Gulf of Mexico and limited freshwater inflow, has been characterized as a hypersaline estuary (Simmons 1957, Breuer 1962a), with salinities of 50-60 o/oo common. The Intracoastal Waterway provides for limited water exchange at both ends of the lagoon. Since the dredging of the Intracoastal Waterway salinity "has neither risen above 80 o/oo in the lagoon nor in Baffin Bay (where 100 o/oo was formerly not uncommon), nor have waters of very low salinity remained in the area any length of time" (Simmons 1957).

The only substantial source of freshwater is runoff from the Kenedy, Kleberg, Jim Wells and Nueces County watersheds into the Baffin Bay system (Breuer 1957). The dry sand on Padre Island absorbs rain very rapidly and the very gradual slope of the lagoon's western shore makes these areas poor watersheds (Simmons 1957).

The upper Laguna Madre system lies in two climatic zones--north of Baffin Bay is sub-humid; south of that point is semi-arid (Simmons 1957). Rainfall in the area is highly variable but averages 27.0-29.1 inches annually (NOAA, Env. Data Svcs., Natl. Climatological Center, Ashville, N. C. 1976). Annual average surface water temperatures for the period 1969-1972 ranged from 73.6 to 76.3 F in the upper lagoon (Martinez 1969, 1970, 1971 and 1972). No data concerning water temperature from Baffin Bay is available. Southeast or south-southeast winds are prevalent during most of the year and are directly responsible for the water circulation in the system (Simmons 1957). Water in the upper lagoon is generally clear (annual average turbidity during 1969-1972 ranged from 36.8 to 45.6 JTU) (Martinez 1969, 1970, 1971 and 1972); while water in Baffin Bay is often turbid and at times becomes a dark brown (Breuer 1957).

The bottom in the upper lagoon consists primarily of quartzose sand, silt and shell with some calcareous sand or mud in isolated areas (Simmons 1957). In the Baffin Bay system bottom types of soft mud, soft and hard clay, sand and concentrated shell (mostly Mulinia lateralis) can be found. Also, in Baffin Bay and near the junction of Baffin Bay and the upper Laguna Madre are extensive rock formations consisting of serpulid worm tubes, calcareous and quartzose material.

Simmons (1957) and Breuer (1957) reported dense vegetation--shoalgrass and widgeon grass--restricted to the northern one-third of the lagoon. They indicated that the remainder of the system has only sparse to moderate vegetation, with the exception of the area near the entrance to Baffin Bay and areas around spoil islands.

The only substantially populated center adjacent to the upper Laguna Madre is Corpus Christi, Texas, with a population of 204,525 (U. S. Dept. Commerce 1970a). An additional 33,166 people in Kleberg County (U. S. Dept. Commerce 1970b) are located near the Baffin Bay system.

Industrialization in the area has been held to a minimum because of limited access to the surrounding land. The only major industry in the system is a public utility (Central Power and Light Co.) which displaces approximately 3.3 million gal of water/min from the upper Laguna to Oso Bay (Mr. M. L. Shepherd, Central Power and Light Co., June 1976, Personal Communication). Most of the area surrounding Baffin Bay is private ranchland and consequently there is little urban development. There is considerable oil and gas development on these ranches, resulting in large quantities of oilfield brine production. In most cases the brine has been discharged into the bay or a creek which leads to the bay. Mackin (1971) reported that approximately 2,728,897 gal of oilfield brine is discharged each day into Petronilla Creek and thence into Alazan and Baffin Bays.

Lower Laguna Madre

The lower Laguna Madre is a long shallow bay that extends 55 miles northward from Port Isabel to the Kenedy Land Cut (Fig. 8). It varies from 3 miles

to 7.8 miles wide and is imperfectly bisected by the Intracoastal Waterway. The bay is bounded on the west by the Texas mainland and on the east by Padre Island and contains approximately 182,809 acres (Stokes 1974). Passes to the Gulf of Mexico are located near Port Isabel and east of Port Mansfield. Limited amounts of fresh water (average of 818.9 gal/s) enter lower Laguna Madre from the Arroyo Colorado and North Floodway (Bryan 1971).

Except for the Intracoastal Waterway with an average depth of 12.0 ft, the deepest areas are found in the northern and southern portions of the bay (Breuer 1962a). In the northern section, which extends from Port Mansfield to the Kenedy Land Cut, water depth is as much as 7.9 ft. From Port Mansfield south to Three Islands the water is shallow with most locations being < 3.0 ft deep. South of Three Islands the maximum water depth is 5.9 ft and water depths of 3.9-4.9 ft are prevalent.

Bottom types consist of sand, silty sand or a combination of sand, silt and clay (Shepard and Rusnak 1957). Shell is not commonly found in lower Laguna Madre. In general, sediments are coarser along the eastern or Padre Island side of the bay than along the western or mainland side of the bay.

Shoalgrass is the most common type of vegetation found in lower Laguna Madre (Stokes 1974). Dense stands of shoalgrass can be found in shallow water along most of the shoreline as well as in the entire middle portion (Port Mansfield to Three Island) of the bay. Light to dense stands of manatee grass (*Cymodocea filiforme*), turtle grass, widgeon grass, Halophila engelmannii and Acetabularia crenulata can be found scattered throughout the bay.

Hydrological parameters have been described by Stokes (1974). Average monthly salinities range from 16.0 to 41.0 o/oo. Excluding the Arroyo Colorado and North Floodway, salinities as low as 10.5 o/oo and as high as 44.9 o/oo are sometimes encountered. Average monthly bottom water temperatures range from 62.6 F during some winter months to 81.5 F in August. Turbidity values are generally highest from Port Mansfield to Three Islands (the shallowest portion of the bay). The average annual turbidity value in this region is 45 JTU. North of Port Mansfield the average turbidity is 28 JTU and south of Three Islands the average is 32 JTU.

The total population for the counties bordering lower Laguna Madre is 162,608 (Harlingen Chamber of Commerce). In 1973, 1,278,000 out-of-state residents visited the lower Rio Grande Valley. Although there are no figures available, it is probable that many of these people visited this area because of water related activities in lower Laguna Madre. Farming and ranching are the main industries along the bay. The only area of heavy industry is the Brownsville Ship Channel where several shrimp processing plants, a Union Carbide plant, a grain elevator, three ship dismanteling plants, two oil loading docks and an oil rig construction company are located.

Appendix B. Gill net station locations.

Table 1. Gill net station locations in each bay system, October 1978-September 1979.

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Galveston	Galveston	1	29°32'05"	95°00'35"	1.0 mile SE of Clear Creek entrance channel
	Galveston	2	29°30'50"	94°59'00"	0.3 mile W of surfaced ramp in Bacliff, Texas
	Galveston	3	29°30'20"	94°57'05"	0.3 mile E of HL & P Company's P. H. Robinson Generation Station's discharge canal
	Dickinson	4	29°28'00"	94°57'30"	N shoreline of Dickinson Bayou
	Dickinson	5	29°27'45"	94°56'40"	0.5 mile SE of junction of Dickinson Bayou and Bay
	Moses Lake	6	29°26'10"	94°56'10"	NW shore of Moses Lake

Table 1. (Cont'd.).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Aransas	Aransas	22	28°05'10"	96°55'33"	On San Jose Island near Jay Bird Reef marker
	Aransas	23	28°06'03"	96°54'22"	S of Spalding Reef near TPWD post marker
	Aransas	24	28°06'40"	96°53'25"	SE end of Shell Reef at mouth of Spalding Bight
	Aransas	25	28°06'48"	96°55'26"	On SE side of SW tip of Dunham Island
	Dunham	26	28°07'57"	96°55'05"	On Grass Island at mouth of Dunham Bay
	Dunham	27	28°08'53"	96°54'22"	In NE most end of Dunham Bay
	Aransas	28	28°59'52"	96°58'47"	At the break between Allyn's Lake and the bay 200 yds N of duck blind
	Aransas	29	28°07'20"	96°56'45"	Midway between Dunham and Blackjack Point
	Aransas	30	28°00'00"	97°03'31"	Just S of Perry Bass docking facilities
	Aransas	31	28°06'15"	97°01'07"	On NE tip of Live Oak Point near reef marker
	Aransas	32	28°05'21"	97°02'00"	Off Fulton beach about 1.0 mile S of Racquet Club in front of Dr. Foster's residence
	Aransas	33	28°04'16"	97°02'07"	Along bulkhead shoreline just S of Sandollar Motel
	Aransas	34	28°04'38"	96°57'53"	On island at end of Halfmoon Reef near ICWW Marker 22
Carlos Copano	35	28°07'05"	96°53'07"	In SE corner of Carlos Bay	
	36	28°05'05"	97°04'34"	Approximately 1.0 mile SW of airport	
	Mesquite	37	28°07'09"	96°51'08"	1.5 miles W. of mouth of Cedar Bayou
Mesquite	38	28°06'58"	96°49'55"	At mouth of Cedar Bayou, W side	
	39	28°07'18"	96°48'50"	In SE Mesquite Bay about 1.0 mile NE of mouth of Cedar bayou	

Table 1. (Cont'd).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Aransas	Mesquite	40	28°08'21"	96°48'07"	At end of Bray Cove
	Mesquite	41	28°08'55"	96°49'04"	Matagorda Island, 1.5 miles S of Ayres Dugout
	Mesquite	42	28°10'01"	96°49'55"	At Ayres Dugout on the Mesquite Bay side
	Mesquite	43	28°10'23"	96°51'07"	Off Roddy Island in N part of Mesquite Bay
	Mesquite	44	28°09'55"	96°52'32"	1.0 mile SW of Sundown-Mesquite Bay Pass
	Carlos	45	28°08'52"	96°53'08"	S side of Cedar Point
	Carlos	46	28°07'50"	96°54'15"	On NE side of Cape Carlos by first refuge marker
	St. Charles	47	28°08'03"	96°57'38"	Off Bird Point inside St. Charles Bay
	St. Charles	48	28°09'57"	96°56'53"	Just S of Egg Point near clump of trees and refuge marker
	St. Charles	49	28°10'35"	96°56'18"	Point of land just N of Bill Mott Bayou
	St. Charles	50	28°12'05"	96°55'43"	Between Little Devil Bayou and Big Devil Bayou
	St. Charles	51	28°13'00"	96°56'33"	At Meile Dietrich Point
	St. Charles	52	28°14'32"	96°55'34"	Just N of McHugh Bayou
	St. Charles	53	28°16'10"	96°54'55"	At mouth of Twin Creek
	St. Charles	54	28°15'00"	96°56'30"	At mouth of Salt Creek outside cove
	St. Charles	55	28°13'41"	96°57'26"	1.5 miles SW of mouth of Salt Creek
	St. Charles	56	28°13'04"	96°58'47"	Inside Cavasso Creek close to Highway 35
	St. Charles	57	28°11'55"	96°56'50"	0.5 mile NW of Big Sharps Point
	St. Charles	58	28°10'53"	96°57'16"	0.5 mile SW of Little Sharps Point
	St. Charles	59	28°10'00"	96°58'00"	On S side of Cow Chip Slough

Table 1. (Cont'd).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Aransas	St. Charles	60	28°08'53"	96°58'20"	Just N of the Big Tree
	St. Charles	61	28°07'57"	96°58'28"	On SE tip of Mail Point
	Copano	62	28°08'10"	97°00'37"	On Lamar Peninsula on W side at N end of Copano Causeway
	Copano	63	28°09'01"	97°01'42"	On W tip of Newcomb Point
	Copano	64	28°09'43"	97°01'08"	Just S of Holiday Beach channel; Palmetto Point
	Copano	65	28°11'00"	97°01'05"	At W end of Shell Point near duck blind
	Copano	66	28°11'52"	97°00'42"	On a point of land 1.0 mile E of Turtle Pen Point
	Copano	67	28°12'07"	97°02'07"	On N side of the mouth of Copano Creek
	Copano	68	28°11'54"	97°01'14"	On S side of Turtle Pen Point
	Copano	69	28°11'18"	97°02'21"	1.5 miles SW of Turtle Pen Point
	Copano	70	28°10'41"	97°04'00"	About 3.0 miles SW of Turtle Pen Point
	Copano	71	28°10'00"	97°05'27"	About 4.5 miles SW of Turtle Pen Point
	Copano	72	28°08'57"	97°07'22"	Just to the NW of Copano Reef
	Mission	73	28°10'00"	97°08'27"	About 1.5 miles N of mouth of Mission Bay
	Copano	74	28°07'57"	97°09'27"	Between the mouth of Mission Bay and Shellbank Reef
	Copano	75	28°06'41"	97°11'15"	Approximately 1.5 miles NE of Bayside
	Copano	76	28°05'32"	97°13'28"	0.2 mile W of bridge at Black Point
	Copano	77	28°03'45"	97°13'22"	On S side of the mouth of the Aransas River
	Copano	78	28°04'18"	97°12'39"	0.5 mile E of the S end of Bayside bridge on Egery Island
	Copano	79	28°03'39"	97°11'05"	2.0 miles SE of the S end of Bayside Bridge; Rincon de la Cera

Table 1. (Cont'd).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Aransas	Copano	80	28°03'09"	97°09'07"	On N side at the E most island forming Swan Lake
	Port	81	28°01'57"	97°08'53"	On NW end of the old bridge ruins across Port Bay
	Port	82	28°01'15"	97°09'14"	1.0 mile SW of Port Bay Bait Stand, on E tip of land forming horseshoe
	Port	83	28°00'17"	97°09'23"	On point of land 0.8 mile NE of Highway 881 bridge on W side of bay
	Port	84	27°59'29"	97°10'15"	On E shore just S of Highway 881 bridge
	Port	85	27°58'53"	97°10'40"	On W shore 1.0 mile SW of Highway 881 bridge
	Port	86	27°59'54"	97°08'56"	0.8 mile due S of Port Bay ranch house near slough
	Port	87	28°01'05"	97°08'31"	0.5 mile S of E side of old bridge ruins
	Port	88	28°01'45"	97°07'47"	0.5 mile E of Port Bay Bait Stand
	Port	89	28°02'19"	97°07'48"	At point of land forming NW boundary of Italian Bend
	Copano	90	28°04'38"	97°06'03"	Hannibal Point
	Copano	91	28°05'50"	97°03'04"	The third T-head NE of Copano Village; close to airport
	Copano	92	28°07'03"	97°03'12"	On W tip of Redfish Point near old barge
	Mesquite	93	28°08'13"	96°53'21"	In Mesquite Bay 2.5 miles NW from mouth of Cedar Bayou
Aransas	Redfish	94	27°54'10"	97°05'47"	On S side of NE tip of Hog Island
	Aransas	95	28°02'27"	96°57'02"	0.5 mile SW of Pauls Mott reef marker
Redfish		96	27°58'22"	97°04'50"	Off ICWW spoil near oil well inside Estes Cove
	Mission	97	28°08'37"	97°08'20"	Just inside Mission Bay mouth on E side

Table 1. (Cont'd.).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Aransas	Mission	98	28°08'05"	97°10'10"	In Mission Bay on W shore due S of river entrance
	Copano	99	28°04'07"	97°05'45"	Inside Salt Lake off well pads
	Redfish	100	27°54'47"	97°07'42"	1.0 mile N of Aransas Pass Harbor, W of ICWW Marker 35

Table 1. (Cont'd.).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Corpus Christi	Nueces	1	27°49'12"	97°27'45"	2 miles W of westerly powerlines on S shore
	Nueces	2	27°52'52"	97°20'11"	2 miles NE of clay pits
	Nueces	3	27°52'09"	97°20'30"	0.2 mile NW of old Ramada Inn
	Nueces	4	27°52'50"	97°21'28"	1 mile E of clay pits
	Nueces	5	27°52'15"	97°26'27"	1 mile W of westerly powerlines on N shore
	Nueces	6	27°52'12"	97°25'05"	0.5 mile E of westerly powerlines on N shore
	Corpus Christi	7	27°51'24"	97°20'42"	0.8 mile N of Indian Point pier
	Nueces	8	27°53'00"	97°29'39"	0.5 mile NW of shallow cove on N shore
	Nueces	9	27°51'47"	97°27'52"	On E shore of first cove to the E of White Point
	Nueces	10	27°52'30"	97°30'40"	3 miles W and N of river cut
	Nueces	11	27°51'10"	97°30'00"	0.5 mile W of river cut on S shore
	Nueces	12	27°52'00"	97°29'00"	On W shore of White Point
	Nueces	13	27°52'28"	97°22'38"	Just W of clay pits
	Nueces	14	27°52'29"	97°23'38"	0.2 mile W of easterly powerlines on N shore
	Nueces	15	27°50'14"	97°23'15"	Just SW of the W.R.I.P. canal
	Nueces	16	27°50'15"	97°29'23"	Due S of island at Nueces River mouth
	Nueces	17	27°49'36"	97°25'38"	0.5 mile W of westerly powerlines on S shore
	Corpus Christi	18	27°41'34"	97°11'26"	0.2 mile S of water exchange pass (W.E.P.)
	Corpus Christi	19	27°46'00"	97°09'53"	Just S of tanks on NE end at Shamrock Island
	Corpus Christi	20	27°45'05"	97°08'49"	0.2 mile S of sportsmen club cabin
	Corpus Christi	21	27°46'35"	97°07'54"	0.2 mile NE of Sinclair Cut
	Corpus Christi	22	27°45'11"	97°10'20"	Extreme southern tip of Shamrock Island

Table 1. (Cont'd) .

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Corpus Christi	Corpus Christi	23	27° 50' 28"	97° 09' 41"	0.2 mile S of Dagger Point on S shore
	Corpus Christi	24	27° 43' 27"	97° 10' 05"	0.5 mile S of boat cove by Tenneco pumping station
	Corpus Christi	25	27° 49' 53"	97° 10' 26"	0.2 mile N of southern tip of Dagger Island on S shore
	Nueces	26	27° 51' 15"	97° 29' 05"	Off N side of spoil island, 0.5 mile N of river cut
	Corpus Christi	27	27° 42' 40"	97° 10' 32"	1 mile N of W.E.P.
	Corpus Christi	28	27° 50' 51"	97° 14' 09"	Welder Point, just NW of house on bluff
	Corpus Christi	29	27° 42' 22"	97° 17' 26"	0.5 mile NW of N.A.S. bulkheads
	Corpus Christi	30	27° 52' 29"	97° 18' 14"	2 miles W of jetties on La Quinta shore
	Corpus Christi	31	27° 51' 58"	97° 19' 37"	2 miles NE of Indian Point Pier
	Nueces	32	27° 51' 30"	97° 21' 45"	On spoil area, 0.5 mile NE of Nueces Bay causeway
	Corpus Christi	33	27° 49' 50"	97° 22' 48"	On the beach just SW of Rincon Point
	Corpus Christi	34	27° 45' 54"	97° 22' 56"	1 mile SE of Holiday Inn on Ocean Drive
	Corpus Christi	35	27° 43' 28"	97° 20' 40"	0.8 mile NW of Oso Fishing Pier
	Corpus Christi	36	27° 52' 48"	97° 16' 45"	0.8 mile W of jetties on La Quinta shore
	Corpus Christi	37	27° 41' 42"	97° 14' 51"	On N shore of Demit Island
	Corpus Christi	38	27° 42' 51"	97° 19' 09"	0.8 mile SE of Oso Fishing Pier
	Corpus Christi	39	27° 41' 18"	97° 13' 17"	N shore of spoil area near ICWW Marker 3
	Corpus Christi	40	27° 45' 14"	97° 09' 29"	0.2 mile N of Glenn Cove
	Corpus Christi	41	27° 46' 22"	97° 08' 49"	0.5 mile SW at Sinclair Cut, N of tanks
	Redfish	42	27° 50' 12"	97° 10' 11"	Middle of N shore at Dagger Point
	Corpus Christi	43	27° 49' 40"	97° 10' 46"	On S shore of spoil area just SW of Dagger Island

Table 1. (Cont'd).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Corpus Christi	Corpus Christi	44	27° 50' 46"	97° 09' 22"	On S shore of spoil area, 0.2 mile NE of Dagger Island
	Redfish	45	27° 51' 03"	97° 08' 08"	On SE shore of S. Ransom Island
	Corpus Christi	47	27° 44' 28"	97° 22' 06"	2.25 miles NW of Oso Fishing Pier
	Redfish	48	27° 52' 15"	97° 08' 04"	In the middle of E shore of N Ransom Island
	Redfish	49	27° 52' 11"	97° 08' 07"	In the middle of W shore of N Ransom Island
	Redfish	50	27° 53' 15"	97° 07' 01"	On W shore of Stedman Island
	Redfish	51	27° 51' 25"	97° 09' 46"	0.25 mile E of ICWW Marker 52 on NE side of spoil
	Corpus Christi	52	27° 49' 26"	97° 07' 55"	On SW shore of Point of Mustang
	Redfish	53	27° 52' 41"	97° 08' 20"	On SW shore of long spoil area just N of N Ransom Island
	Corpus Christi	54	27° 51' 01"	97° 21' 34"	0.25 mile SW of Indian Point Pier
	Corpus Christi	55	27° 50' 08"	97° 07' 14"	0.3 mile NE of CCSC Marker 14
	Redfish	56	27° 50' 51"	97° 07' 21"	0.8 mile E of S Ransom Island on spil area
	Corpus Christi	57	27° 49' 30"	97° 07' 10"	1 mile E of Pt. of Mustang on S shore
	Corpus Christi	58	27° 45' 21"	97° 08' 21"	0.5 mile SE of green cabin in Shamrock Cove
	Corpus Christi	59	27° 49' 20"	97° 08' 56"	0.2 mile SSW of CCSC Marker 19 on N side of spoil area
	Corpus Christi	60	27° 49' 18"	97° 09' 43"	0.3 mile E of CCSC Marker 25 on N side of spoil area just W of tanks
	Corpus Christi	61	27° 48' 56"	97° 11' 15"	On N side of spoil area just S of CCSC Marker 31
	Corpus Christi	62	27° 48' 45"	97° 11' 41"	On S shore, 1.5 miles NE of W tip of chain of CCSC spoil areas

Table 1. (Cont'd).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Corpus Christi	Corpus Christi	63	27°48'26"	97°13'05"	0.2 mile SE of W tip of chain of CCSC spoil area
	Corpus Christi	64	27°48'47"	97°12'29"	0.2 mile SE of CCSC Marker 36
	Corpus Christi	65	27°49'28"	97°13'10"	Just N of La Quinta Channel Marker 6 in front of houses
	Corpus Christi	66	27°50'05"	97°13'21"	Just SW of Ingleside Cove public ramp
	Corpus Christi	67	27°49'59"	97°13'38"	On N side of island just S of La Quinta Channel Marker 8
	Corpus Christi	68	27°48'38"	97°14'07"	0.8 mile SE of Ingleside Point
	Redfish	70	27°51'22"	97°08'48"	Off SW tip of island that is 0.5 mile SW of N Ransom Island
	Corpus Christi	71	27°52'22"	97°15'42"	Just SW of La Quinta Channel Marker 19
	Corpus Christi	72	27°44'36"	97°09'38"	Just SW of Arco plant at bay end of Wilson's Cut
	Redfish	73	27°53'33"	97°07'32"	0.5 mile SE of Conn Brown Harbor Bridge on S shore of spoil area
	Oso	74	27°42'25"	97°18'30"	On spoil just S of Oso Bridge
	Redfish	75	27°52'14"	97°05'59"	At S end of oil well cut, 1.25 miles SE of Fin and Feather Marina
	Corpus Christi	76	27°50'24"	97°06'06"	On N side of spoil area, 0.2 mile N of CCSC Marker 8
	Corpus Christi	77	27°45'34"	97°08'57"	Pink Shack Cove
	Corpus Christi	78	27°49'00"	97°07'30"	East Flats
	Redfish	79	27°52'31"	97°08'48"	0.2 mile SE of ICWW Marker 44 on S shore of spoil area
	Corpus Christi	80	27°44'04"	97°09'39"	Boat cove

Appendix E. Hydrological data summary.

Table 1. Monthly mean^a surface salinity (o/oo) at sampled gill net, trammel net and bag seine stations in each Texas bay system during October 1978-September 1979.

Month and year	Galveston	East Matagorda ^b	Matagorda	San Antonio	Aransas	Corpus Christi	upper Laguna Madre	lower Laguna Madre
Oct. 1978	21.4	18.0	14.4	13.4	10.2	26.0	40.1	21.5
Nov. 1978	22.8	19.5	17.6	17.1	14.5	25.9	36.9	18.6
Dec. 1978	19.6	20.5	18.8	16.1	14.8	28.2	36.4	24.8
Jan. 1979	19.8	13.4	13.8	15.3	12.7	26.6	34.1	31.9
Feb. 1979	11.6	14.0	8.6	10.9	13.3	24.9	32.1	28.7
Mar. 1979	14.6	14.1	15.7	12.4	11.1	27.2	35.0	28.3
April 1979	13.8	12.8	14.7	13.0	10.7	24.0	36.8	28.8
May 1979	7.6	14.0	7.9	11.3	6.5	18.8	35.1	25.7
June 1979	7.5	10.5	7.8	4.4	6.8	19.1	30.6	23.9
July 1979	10.4	10.1	8.9	2.0	10.0	20.6	30.5	30.1
Aug. 1979	8.3	7.2	10.7	8.1	9.7	26.1	33.8	37.4
Sept. 1979	9.4	7.9	5.8	11.9	5.6	21.0	28.1	22.7

^a Data collected at both the time of gill net set and retrieval are included.

^b Only gill net stations were sampled.

Table 2. Monthly mean^a surface water temperature (C) at sampled gill net, trammel net and bag seine stations in each Texas bay system during October 1978-September 1979.

Month and year	Galveston	East Matagorda ^b	Matagorda	San Antonio	Aransas	Corpus Christi	upper Laguna Madre	lower Laguna Madre
Oct. 1978	23.9	23.2	25.0	25.1	25.0	24.9	26.0	25.4
Nov. 1978	19.7	18.9	17.6	18.4	17.3	17.8	19.3	18.2
Dec. 1978	14.4	11.5	12.1	14.8	16.0	15.5	15.2	14.7
Jan. 1979	5.7	8.8	7.5	9.4	9.2	10.6	10.4	13.2
Feb. 1979	11.2	13.2	13.0	16.0	13.0	14.0	15.3	14.7
Mar. 1979	18.3	18.8	18.5	19.3	19.8	19.8	19.3	19.1
April 1979	21.5	21.3	21.5	23.4	23.0	23.6	24.2	24.9
May 1979	25.4	25.8	24.8	26.7	26.2	26.7	27.6	27.0
June 1979	29.4	28.4	28.6	29.4	28.3	28.4	29.1	28.5
July	30.3	28.1	29.0	29.9	30.1	29.4	29.7	30.8
Aug. 1979	30.5	29.4	30.2	30.2	30.0	29.6	30.2	29.9
Sept. 1979	26.0	25.8	26.8	27.7	27.6	26.9	27.2	27.6

^a Data collected at both the time of gill net set and retrieval are included.

^b Only gill net stations were sampled.

Table 3. Monthly mean^a surface turbidity^b (JTU) at sampled gill net, trammel net and bag seine stations in each Texas bay system during October 1978-September 1979.

Month and year	Galveston	East Matagorda ^c	Matagorda	San Antonio	Aansas	Corpus Christi	upper Laguna Madre	lower Laguna Madre
Oct. 1978	49	24	52	29	39	38	39	35
Nov. 1978	60	24	48	24	29	40	57	33
Dec. 1978	51	28	31	25	30	50	48	31
Jan. 1979	69	24	65	24	65	35	80	48
Feb. 1979	136	24	56	36	54	25	52	74
Mar. 1979	113	24	88	52	79	39	57	42
April 1979	78	34	69	52	32	63	46	52
May 1979	122	42	69	28	63	79	40	35
June 1979	100	43	56	44	60	39	53	82
July 1979	76	66	49	32	45	67	44	35
Aug. 1979	61	78	64	27	46	40	34	24
Sept. 1979	46	42	74	24	34	55	38	57

^a Data collected at both the time of gill net set and retrieval are included.

^b Any measurement < 25 JTU was assigned a value of 24 JTU.

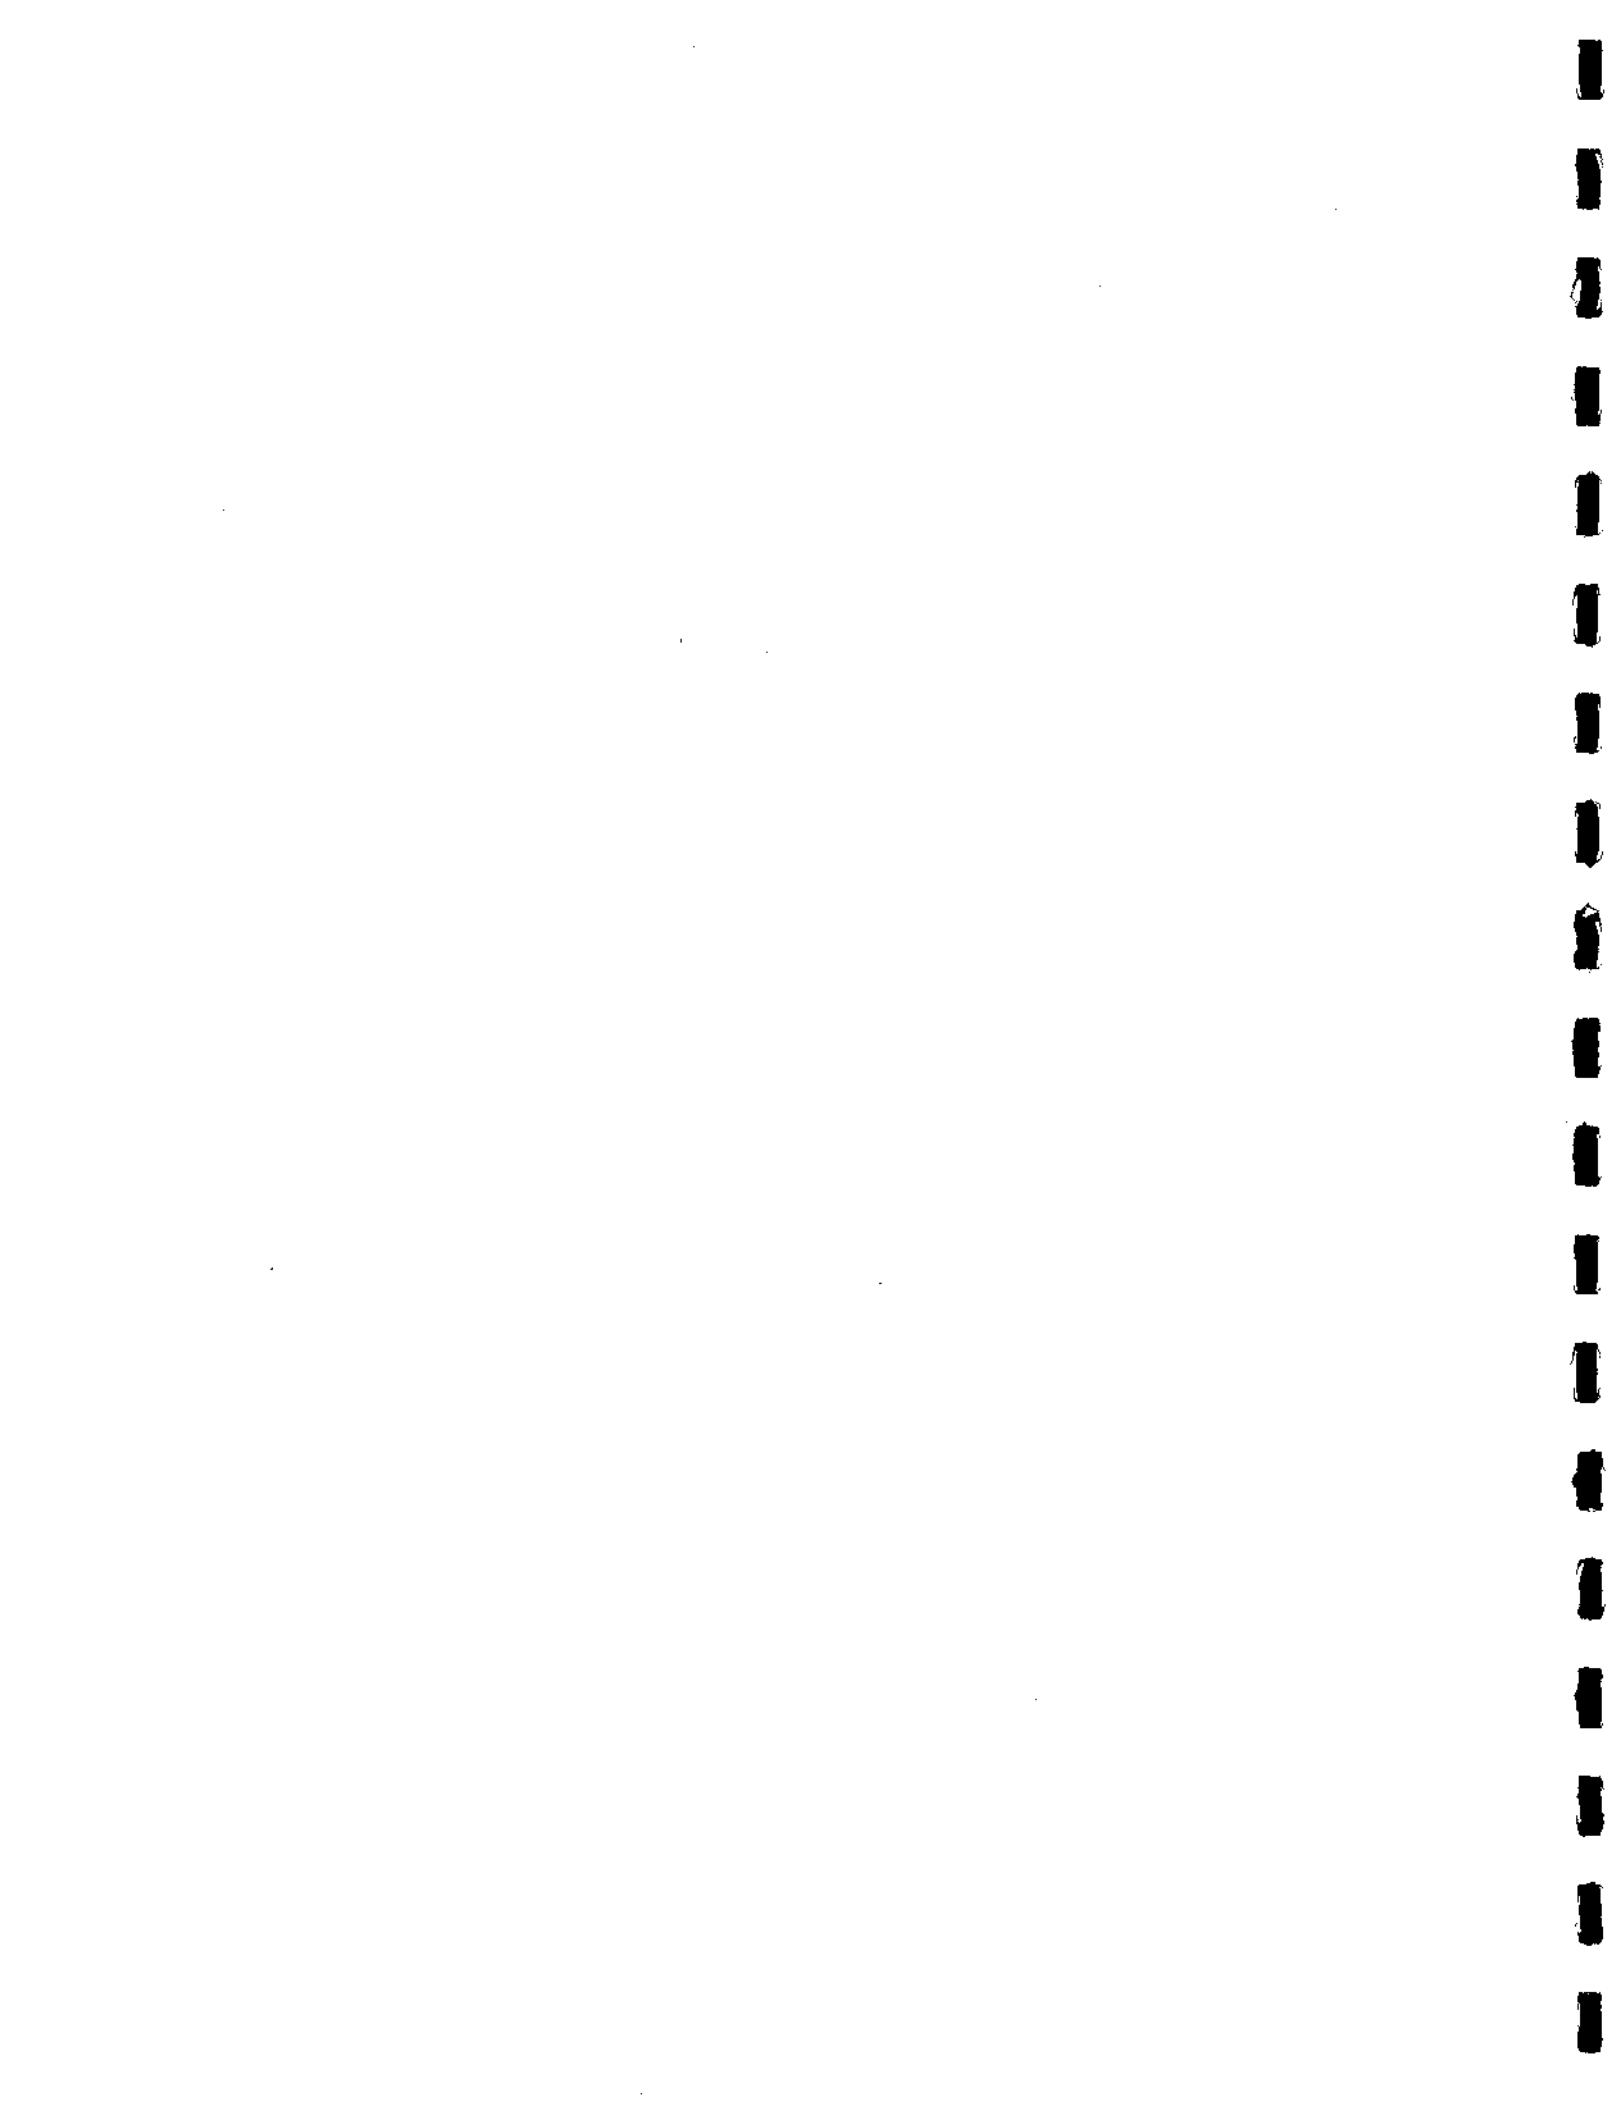

^c Only gill net stations were sampled.

Table 4. Monthly mean^a surface dissolved oxygen (ppm) at sampled gill net, trammel net and bag seine stations in each Texas bay system during October 1978-September 1979.

Month and year	Galveston	Matagorda ^b	East Matagorda	San Antonio	Aransas	Corpus Christi	upper Laguna Madre	lower Laguna Madre
Oct. 1978	9	10	9	8	8	7	7	7
Nov. 1978	8	12	10	9	9	8	8	8
Dec. 1978	12	12	10	8	9	9	7	8
Jan. 1979	11	11	10	6	11	10	8	9
Feb. 1979	11	10	10	7	12	11	8	10
Mar. 1979	12	8	10	6	9	9	8	10
April 1979	10	7	10	8	9	9	7	8
May 1979	11	6	10	10	10	9	8	10
