CHEMICAL AND PHYSICAL CHARACTERISTICS OF WATER IN ESTUARIES OF TEXAS OCTOBER 1971-SEPTEMBER 1973

By

Karl W. Ratzlaff
United States Geological Survey

INTRODUCTION

Purpose and Scope of the Investigation

Plans for development and utilization of water resources in Texas include provisions for the use and preservation of water in the estuaries of the State. These provisions require knowledge of the hydrodynamics and of the continuing changes in chemical and physical characteristics of water in the estuaries.

In September 1967, the U.S. Geological Survey and the Texas Water Development Board began a cooperative water-resources investigation of the principal estuaries along the Texas coast (Figure 1) except Galveston Bay, which is being studied by other agencies, and the Rio Grande estuary, which is under the jurisdication of the International Boundary and Water Commission, United States and Mexico.

The objectives of the investigation are to define: (1) The occurrence, source, and distribution of nutrients; (2) the physical, organic, and inorganic water-quality constituents and their areal distribution and time variations; (3) the chemical and physical characteristics of Gulf water that enters the estuaries; (4) the occurrence, quality, quantity, and dispersion of drainage entering the estuarine systems; and (5) the current patterns, directions, and rates of water movement.

The coastal waters of Texas are not classical estuaries, but are similar to them in ecosystems and mixing phenomena. A description of various types of estuaries is presented in "Estuaries," edited by George H. Lauff (1967, p. 3-11). The term estuary, as used in this report, refers to concomitant water bodies in which streamflow mixes with seawater.

Status of the Project

The first three objectives of the project are being met by a three phased water-quality data-collection program of: (1) Reconnaissance for establishment of an optimum data-collection network; (2) repetitive surveys throughout this network to determine the general chemical and physical characteristics of the estuarine systems; and (3) continued data collection at a reduced number of sites or at a reduced frequency to maintain definition of the chemical and physical characteristics of each estuarine system and of the relationship between systems. The first two phases have been completed and the third phase began in September 1973.

The fourth objective of the project is being met by data collection at six continuous streamflow-measuring stations and 11 stations at which monthly data on streamflow and water quality are obtained. Changes in locations and numbers of these stations will be based upon the results of a current study of coastal rainfall-runoff relationships. The dispersion of water entering an estuary is being documented under data-collection activities to meet the first three objectives.

The fifth objective of the project is being met by short-duration, intensive studies of inflow. Two such studies will be completed for each estuary. The studies on the Guadalupe estuary were completed in November 1970 and August 1973; the studies on the Lavaca-Tres

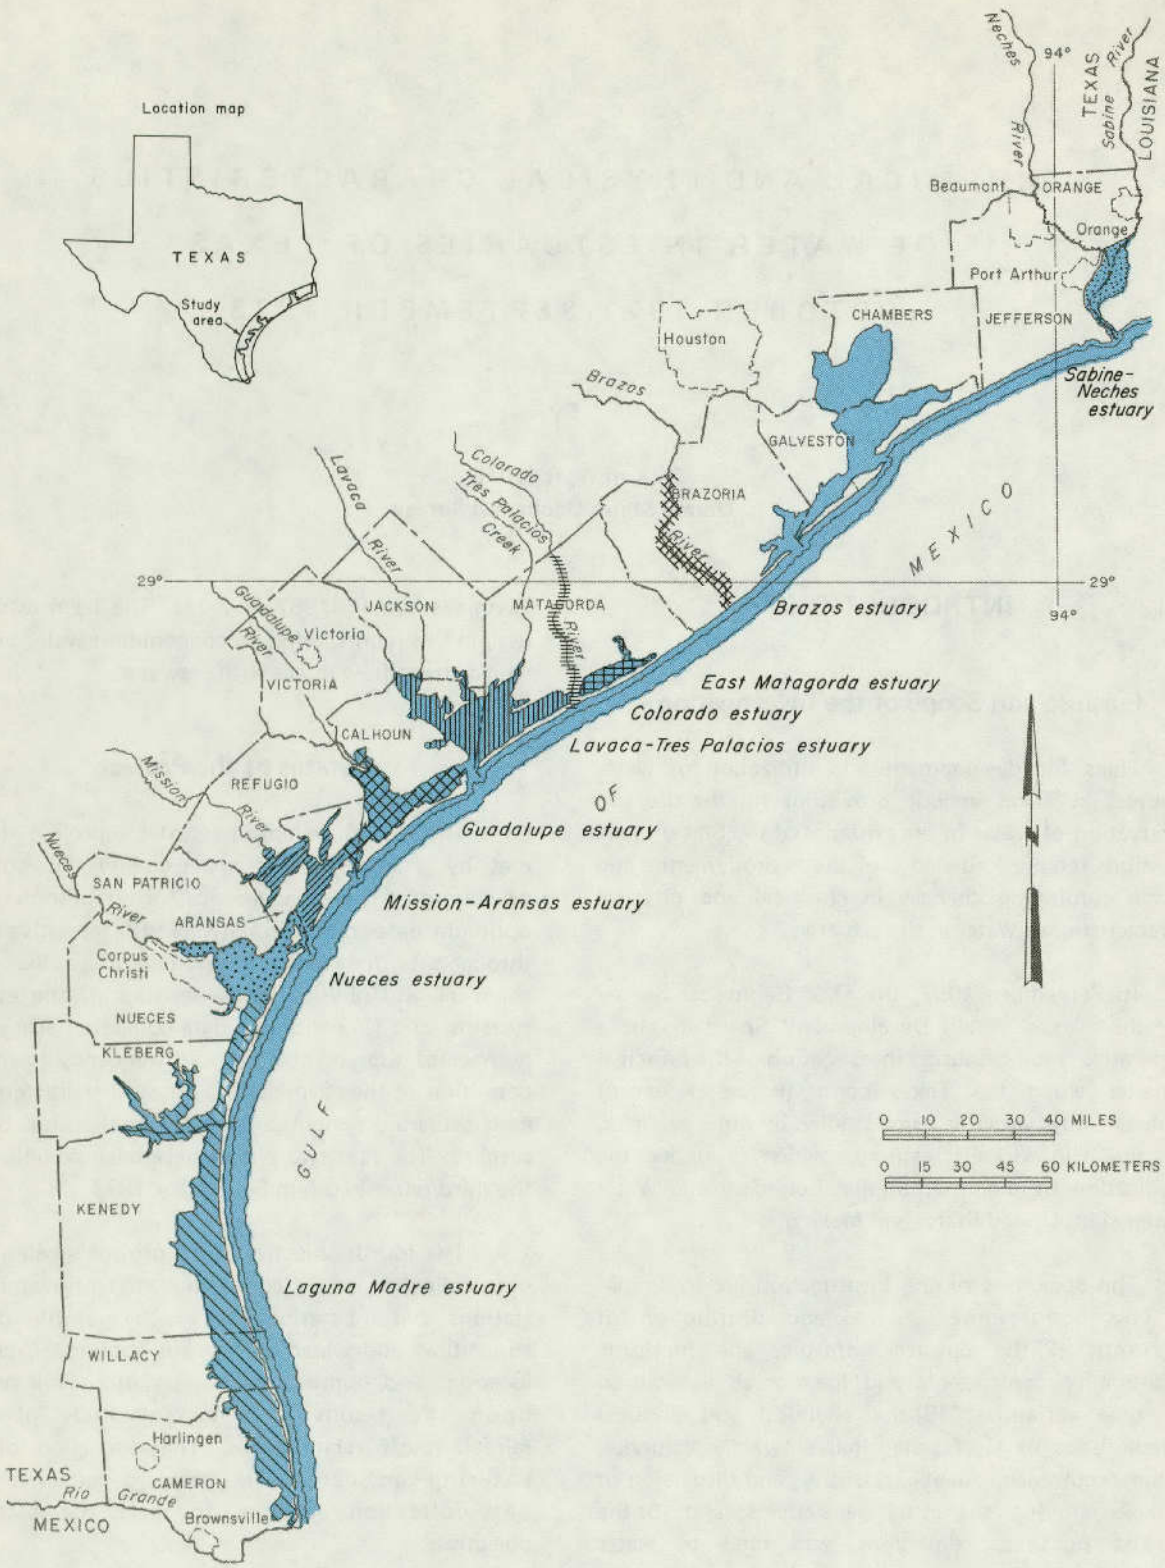

Figure 1
Locations of the Estuaries

Base from Official State Highway Map of Texas, 1971

Palacios estuary were completed in March 1971 and October 1972. One study on the Mission-Aransas and Nueces estuaries was completed in November 1971. These studies are providing data on inflow and exchange of water through the passes.

Previous and Related Reports

This report, fifth in an annual series of basic-data reports (Hahl and Ratzlaff, 1970, 1972, 1973, 1975), presents data collected during water years 1972 and 1973 and includes analyses for selected ions in water from the Guadalupe estuary for water year 1971, which have not been previously published. A report by Grozier and others (1968, p. 47-61) includes data collected during flooding caused by Hurricane Beulah. Interpretive reports will be prepared after sufficient data become available to establish the characteristics of an estuary.

Change in the Numbering System

Chemical and physical data for estuarine waters of Texas collected by the U.S. Geological Survey and by other agencies are being stored in the Texas Water Oriented Data Bank by estuarine name, sample line and site number, and depths at which data were collected. To make the Geological Survey data compatible to storage in the data bank, the original data-collection line-numbering system used before October 1970 needed adjustment. Lists of old and new line numbers appear under the appropriate estuary in the section "Quality of Water in the Estuaries." Most site numbers were not changed; the few that were are given on the list of new numbers.

The original data-collection line-numbering system was not suitable for use in offshore and marsh lands; therefore, under the new system, data-collection lines numbered 600 to 699 are reserved for marsh lands and lines numbered 900 to 999 are reserved for offshore areas.

Each opening along the coast was assigned a "site" number. These site numbers are as follows:

LOCATION	SITE NO.	LOCATION	SITE NO.
Sabine Pass	1	Colorado River	45
Freeport Harbor entrance	30	Greens Bayou	47
Brazos River	31	Matagorda Bay entrance channel	49
Brown Cedar Cut	40	Pass Cavallo	50
Cedar Bayou	65	Corpus Christi Pass	80
North Pass	69	Yarborough Pass	85
Aransas Pass	70	Port Mansfield entrance channel	90
Fish Pass	74	Brazos Santiago Pass	95

International System of Units

Metric equivalents of English units of measurement are given in parentheses in the text. The English units used in this report may be converted to metric units by the following conversion factors:

FROM		MULTIPLY BY	TO OBTAIN	
UNIT	ABBREVIATION		UNIT	ABBREVIATION
inch	–	2.54	centimeter	–
foot	–	.3048	meter	–
mile	–	1.609	kilometer	–
square mile	–	2.590	square kilometer	–
cubic foot per second	ft^3/s	.02832	cubic meter per second	m^3/s

Acknowledgements

The U.S. Army Corps of Engineers at Galveston, the Texas Parks and Wildlife Department, and the Texas Water Development Board provided data and field assistance. Many private citizens and commercial fishermen furnished information on historical changes and existing conditions in the bays.

DATA-COLLECTION METHODS

Approximately 400 data-collection sites were visited yearly during water years 1972 and 1973. About 55 percent of these sites are located adjacent to or between navigation aids, bridge piers, power poles, survey platforms, well structures, or other landmarks and can be reoccupied exactly. About 17 percent of the sites are close to shore features or reefs and are located by onboard radar or by compass heading and distance from the feature and water depth at the site; these sites can be reoccupied within 100 feet (30 meters). About 28 percent of the sites are remote to any reference. They are reached by traveling from a known landmark at a known speed on a predetermined compass course.

Verification of site location is made by checking the alignment of one or more sets of distant landmarks by visual observation or by onboard radar. These sites can be reoccupied within 0.25 mile (0.4 kilometer).

At each data-collection site, field data are collected from several points along a vertical. Samples for laboratory analyses are collected from a predetermined number of data-collection sites and at other sites in the network when significant changes in field data indicate a need for additional samples. Properties or constituents measured in the field are dissolved oxygen, specific conductance, temperature, pH, transparency by Secchi disk, and turbidity. Laboratory analyses include the principal inorganic ions, biochemical oxygen demand (BOD), chemical oxygen demand (COD), coliform and streptococci bacteria, insecticides and herbicides, ammonium, nitrite, nitrate, ortho and total phosphate, and several other selected ions such as aluminum, arsenic, cadmium, chromium, cobalt, copper, iron, lead, lithium, manganese, mercury, nickel, strontium, and zinc.

Field Instruments

The field instruments used in this investigation are as follows, but mention herein of the manufacturers and their instruments does not constitute an endorsement. The information is for identification only.

PARAMETER MEASURED	INSTRUMENT	MODEL	MANUFACTURER
pH	Specific ion meter	401	Orion Research
pH	pH meter	175	Instrumentation Laboratory
Dissolved oxygen	Oxygen meter	54	Yellow Springs Instruments
Specific conductance	Solubridge	RB-3	Industrial Instruments
Temperature	Research thermometer	ET-100 Marine	Allied Research
Turbidity	Colorimeter	DR	Hach Chemical

The instruments used for pH measurements were calibrated daily by using three standards: pH 4.0, 7.0, and 10.0. The dissolved-oxygen meter was calibrated at least daily by using the oxygen-saturation data compiled by the American Public Health Association and others (1966, p. 409). The conductivity meter was calibrated monthly by using at least two standards in each of the three conductivity ranges on the instrument. The electrical thermometer was calibrated weekly. The colorimeter was calibrated at each site.

Probes of the instruments are set in a manifold through which water to be sampled is drawn. Several tests were conducted to determine the effect of streaming potential on electrodes by monitoring instrument output. Dissolved-oxygen readings of water passing through the manifold deviated from the in situ readings by less than 0.1 mg/l (milligrams per liter), and pH readings differed by less than 0.05 pH units.

Treatment of Samples

All water samples except those for insecticide and herbicide analyses were collected in plastic throwaway bottles. The BOD, COD, and nutrient samples were chilled to about 1°C, stored in a refrigerator or ice chest, and shipped to the laboratory as soon as possible. All other samples were stored at ambient temperature.

Water samples for heavy metals and selected trace constituents (except boron, bromide, fluoride, and iodide) were filtered through 0.45-micrometer membrane filters and collected in bottles prewashed with 10 percent nitric acid. Two milliliters of concentrated nitric acid were added to each liter of filtrate.

Water and bottom-sediment samples to be analyzed for herbicides and insecticides were collected in specially treated glass bottles and shipped to the laboratory as soon as possible. Most herbicide and some insecticide samples were depth-integrated water samples; however, most insecticide and some herbicide samples were taken from bottom sediments. Most sediment samples were collected by coring with a 2-inch (5-centimeter) inside-diameter lucite tube and selectively removing 100 grams of material from the center of the core.

Sabine-Neches Estuary

The Sabine-Neches estuary covers an area of about 100 square miles (260 square kilometers) and consists of the tidal parts of the Sabine and Neches Rivers and other tributaries, Sabine Lake, the Sabine-Neches Canal, the Port Arthur Canal, parts of the Intracoastal Waterway, and Sabine Pass (Figure 2). Water depth at mlw (mean low water) is greater than 40 feet (12.2 meters) in dredged parts of the rivers, canals, and pass; about 15 feet (4.6 meters) in the Intracoastal Waterway; and generally 10 feet (3.0 meters) in Sabine Lake.

Water-quality data (Table 1) were collected during September 1972 and May 1973.

The changes in line numbers to facilitate storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all agencies are shown below. New line numbers are used in Table 1 and on Figure 2.

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

Brazos Estuary

The Brazos estuary covers an area of about 3 square miles (8 square kilometers) and consists of the tidal parts of the Brazos River and parts of the Intracoastal Waterway (Figure 3). Although Freeport Harbor is not directly connected with the estuary, wastes from industrial operations around the harbor are discharged into the estuary.

Water-quality data (Table 2) were collected during September 1972 and May 1973.

The changes in line numbers to facilitate storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all agencies are shown below. New line numbers are used in Table 2 and on Figure 3.

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

East Matagorda Estuary

The East Matagorda estuary covers an area of about 56 square miles (145 square kilometers) and consists of East Matagorda Bay, part of the Intracoastal Waterway, the tidal reaches of Caney Creek and Live Oak Bayou, and the tidal part of small tributaries (Figure 4). The maximum water depth at mlw is 5 feet (1.5 meters) in East Matagorda Bay and about 15 feet (4.6 meters) in the Intracoastal Waterway.

Water-quality data (Table 3) were collected during September 1972 and May 1973.

The changes in line numbers to facilitate storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all agencies are shown below. New line numbers are used in Table 3 and Figure 4.

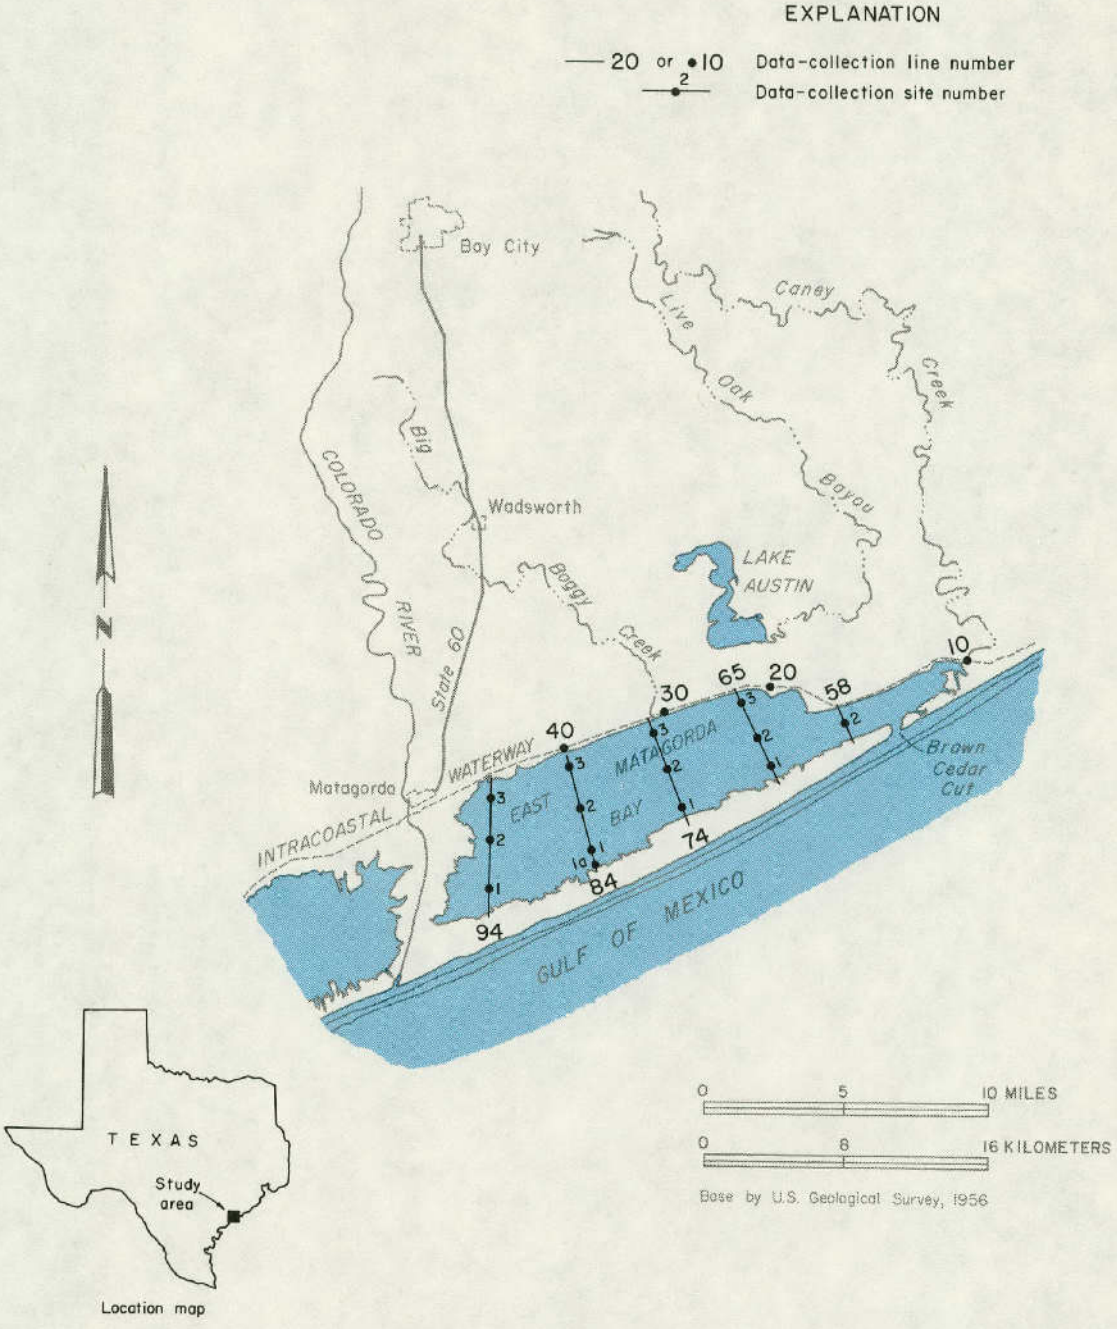

Figure 4.—Data-Collection Sites in the East Matagorda Estuary

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

Colorado Estuary

The Colorado estuary covers an area of about 2 square miles (5 square kilometers) and consists of the tidal part of the Colorado River and part of the Intracoastal Waterway (Figure 5). The minimum depth at mlw is about 6 feet (2.7 meters) in the river channel and about 15 feet (4.6 meters) in the Intracoastal Waterway.

Water-quality data (Table 4) were collected in April and September 1972 and May 1973.

The changes in line numbers to facilitate storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all agencies are shown below. New line numbers are used in Table 4 and on Figure 5.

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

Lavaca-Tres Palacios Estuary

The Lavaca-Tres Palacios estuary covers about 350 square miles (910 square kilometers) and consists of the tidal parts of the Lavaca and Navidad Rivers, Tres Palacios Creek and other tributaries, Lavaca Bay, Cox Bay, Keller Bay, Carancahua Bay, Tres Palacios Bay, Matagorda Bay, Matagorda Bay Entrance Channel, Pass Cavallo, and parts of the Intracoastal Waterway (Figure 6). Water depth at mlw is 13 feet (4.0 meters) or less in Matagorda Bay, except in the Matagorda Ship Channel, which is more than 40 feet (12.2 meters) deep. The rivers generally are less than 15 feet (4.6 meters) deep.

Water-quality data (Table 5) were collected during February, April, May, June, July, August, and October 1972, and January, April, June, and July 1973.

The changes in line numbers to facilitate storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all

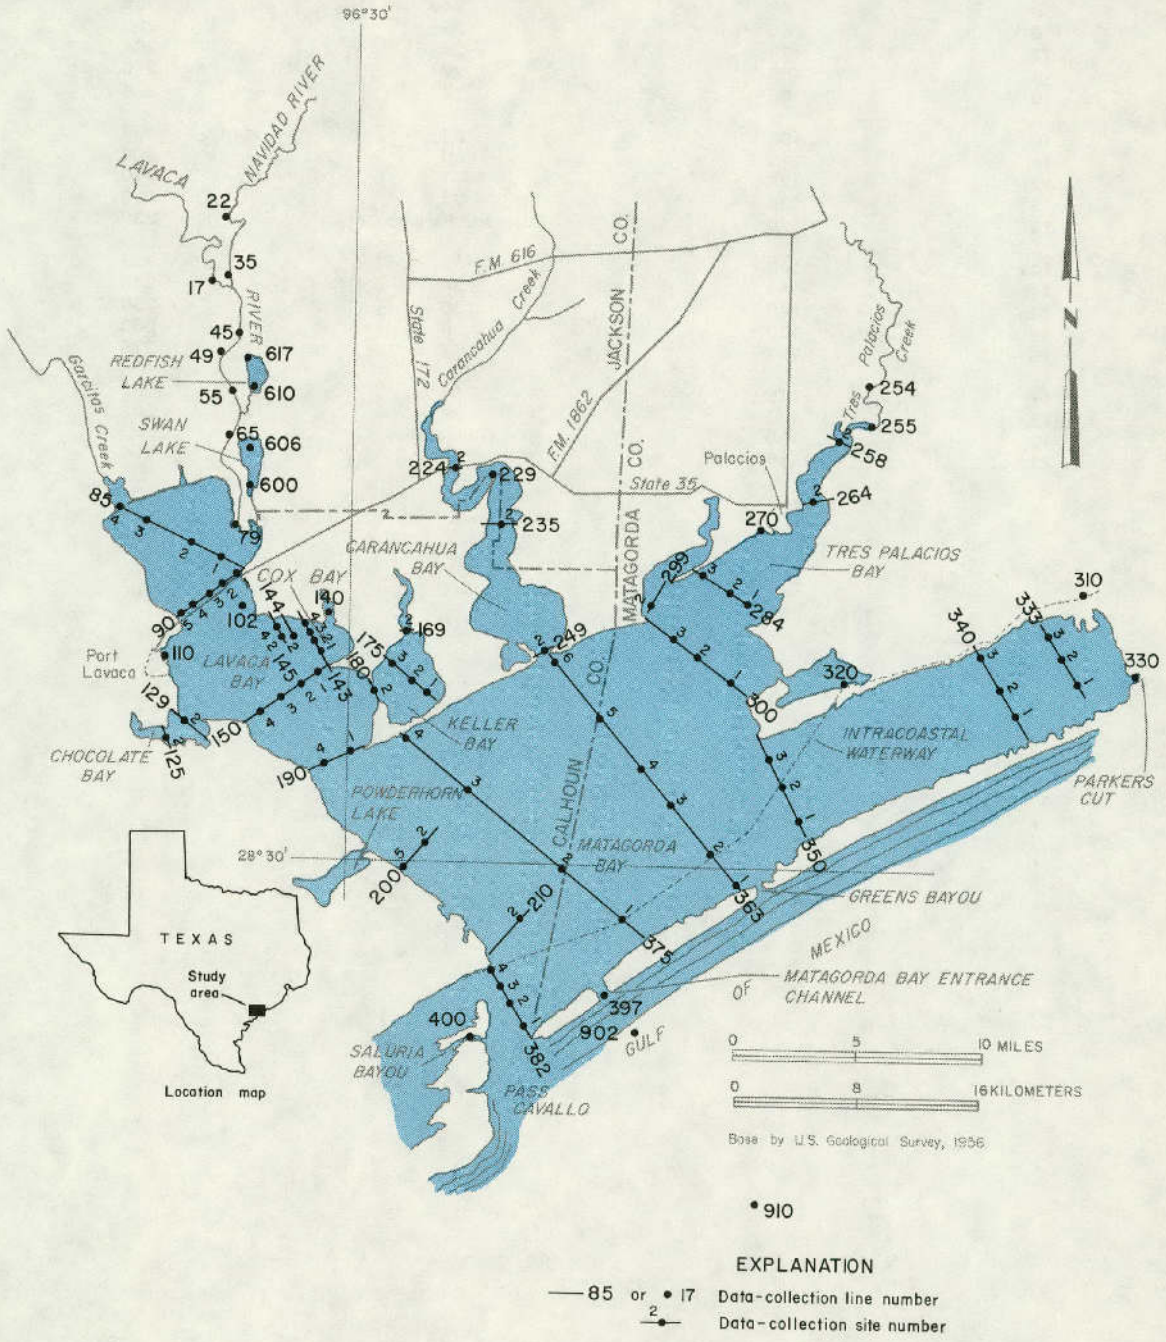

Figure 6.—Data-Collection Sites in the Lavaca-Tres Palacios Estuary

agencies are shown below. New line numbers are used in Table 5 and on Figure 6.

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

Guadalupe Estuary

The Guadalupe estuary covers an area of almost 210 square miles (540 square kilometers) and consists of the tidal parts of the Guadalupe River, Mission Lake, Guadalupe Bay, Hynes Bay, San Antonio Bay, Espiritu Santo Bay, Mesquite Bay, Victoria Channel, and parts of the Intracoastal Waterway (Figure 7). At mlw the Guadalupe River is about 10 feet (3.0 meters) deep; Mission Lake, Guadalupe Bay, and Hynes Bay are less than 3 feet (1.0 meter) deep; San Antonio Bay is less than 6 feet (1.8 meters) deep; Espiritu Santo Bay is about 8 feet (2.4 meters) deep; Mesquite Bay is about 4 feet (1.2 meters) deep; Victoria Channel is more than 8 feet (2.4 meters) deep; and the Intracoastal Waterway is about 15 feet (4.6 meters) deep.

Water-quality data (Table 6) were collected during March, April, May, June, July, September, and December 1972, and March, May, and August 1973.

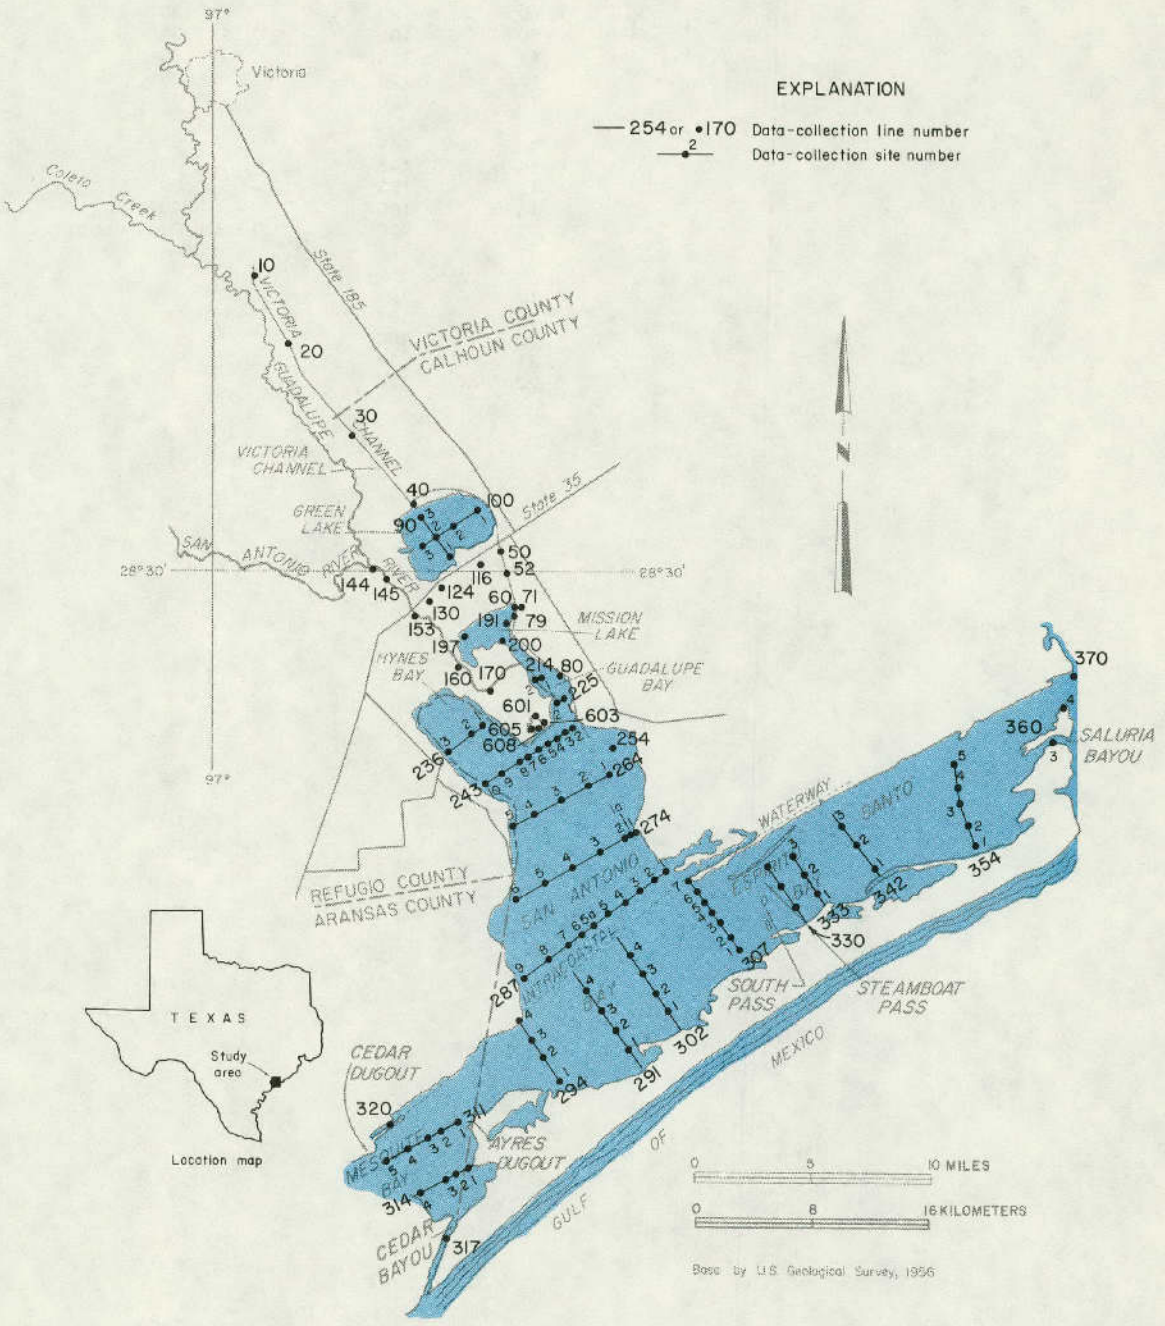

Figure 7.—Data-Collection Sites in the Guadalupe Estuary

Analyses for selected ions for water year 1971 are also shown in Table 6.

The changes in line numbers to facilitate storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all agencies are shown below. New line numbers are used in Table 6 and on Figure 7.

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

Mission-Aransas Estuary

The Mission-Aransas estuary covers an area of about 160 square miles (410 square kilometers) and consists of the tidal parts of Mission River, Aransas River, Copano Creek and other tributaries, Mission Bay, Copano Bay, Aransas Bay, St. Charles Bay, Carlos Bay, part of Redfish Bay, parts of the Intracoastal Waterway, Lydia Ann Channel, and Aransas Pass (Figure 8). Water depth at mlw is less than 2 feet (0.6 meter) in Mission Bay, less than 8 feet (2.4 meters) in Copano Bay, less than 13 feet (4.0 meters) in Aransas Bay, less than 5 feet (1.5 meters) in St. Charles Bay, 4 feet (1.2 meters) or less in Carlos and Redfish Bays, about 15 feet

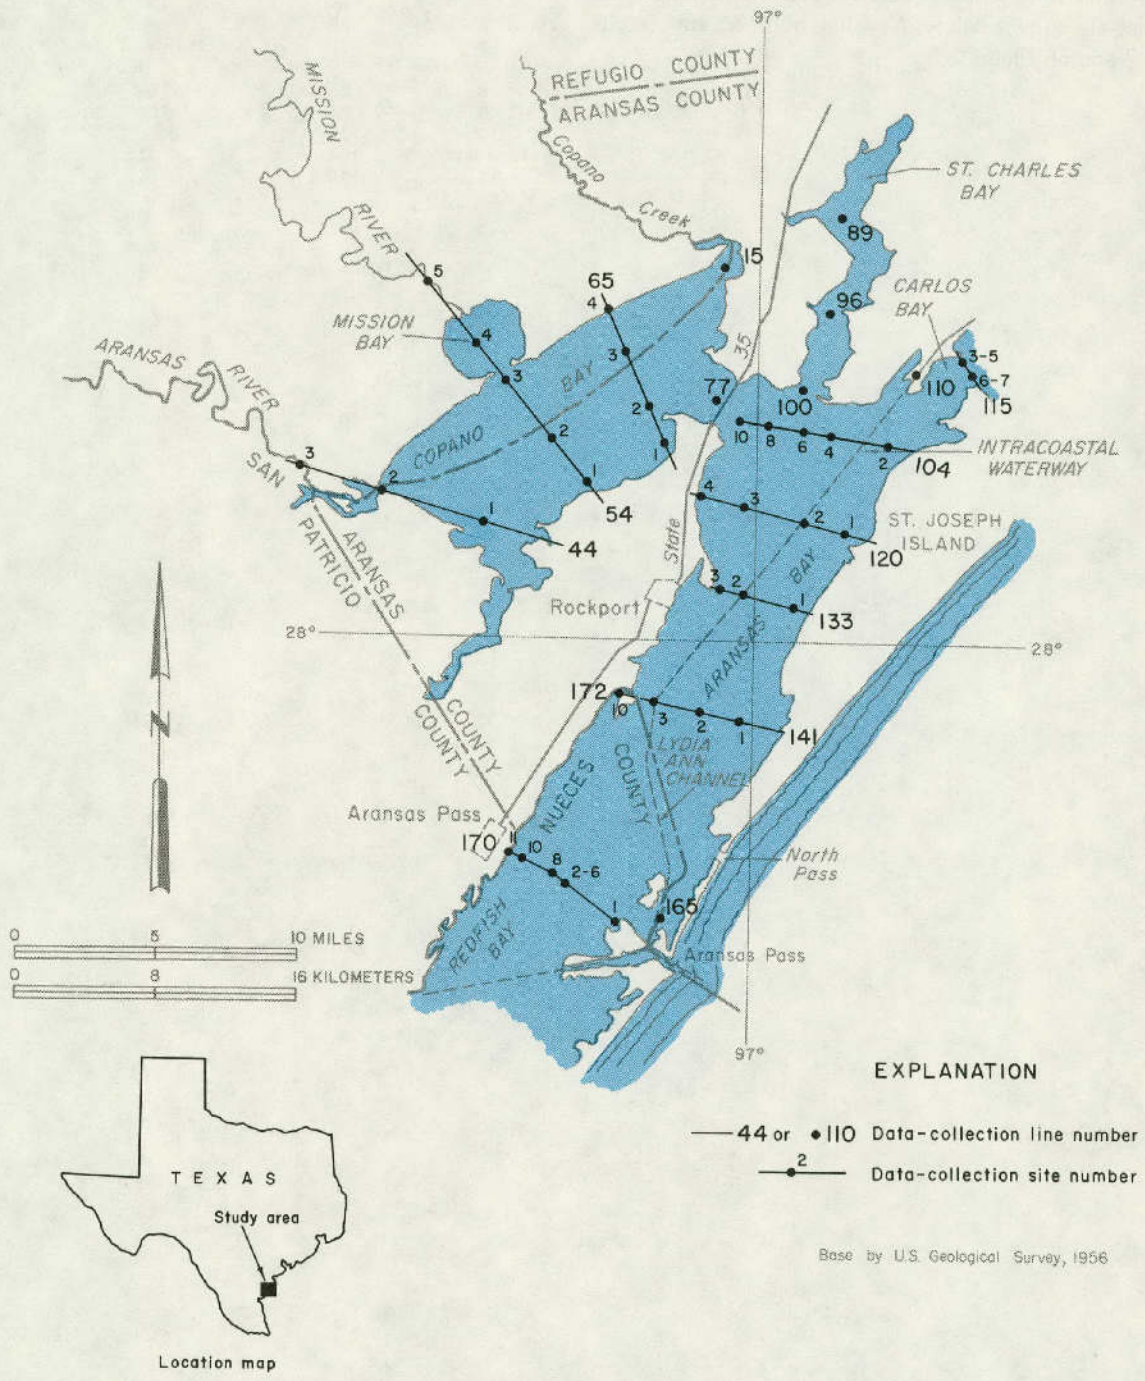

Figure 8.—Data-Collection Sites in the Mission-Aransas Estuary

(4.6 meters) in the Intracoastal Waterway, about 20 feet (6.1 meters) in the Lydia Ann Channel, and more than 40 feet (12.2 meters) in Aransas Pass.

Water-quality data (Table 7) were collected during January, March, May, June, July, September, and November 1972, and February, April, and May 1973.

The changes in line numbers to facilitate storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all agencies are shown below. New line numbers are used in Table 7 and on Figure 8.

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

Nueces Estuary

The Nueces estuary covers an area of about 200 square miles (520 square kilometers) and consists of the tidal parts of the Nueces River and other tributaries, Nueces Bay, Tule Lake Channel, Corpus Christi Bay, part of Redfish Bay, Corpus Christi Ship Channel, Aransas Pass, and parts of the Intracoastal Waterway (Figure 9). Water depth at mlw is less than 13 feet (4.0 meters) in Corpus Christi Bay; less than 3 feet (1.0 meter) in Nueces Bay; more than 40 feet (12.2 meters) in Aransas Pass, Corpus Christi Ship Channel, and Tule Lake Channel; and about 15 feet (4.6 meters) in the Intracoastal Waterway. A part of Redfish Bay is about 10 feet (3.0 meters) deep, but about one-fourth of it is only 1 foot (0.3 meter) deep (mlw).

Water-quality data (Table 8) were collected during January, March, May, June, July, September, and November 1972, and February, April, and May 1973.

The changes in line numbers to facilitate storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all agencies are shown below. New line numbers are used in Table 8 and on Figure 9.

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

Laguna Madre Estuary

The Laguna Madre estuary covers an area of about 640 square miles (1,660 square kilometers) and consists of the tidal parts of the Arroyo Colorado and other tributaries, upper Laguna Madre, Baffin Bay, lower Laguna Madre, Brownsville Ship Channel, part of the Intracoastal Waterway, Port Mansfield Channel, and Brazos Santiago Pass (Figure 10). At mlw, upper and lower Laguna Madre and Baffin Bay are generally less than 4 feet (1.2 meters) deep, but in a few areas are as much as 10 feet (3.0 meters) deep. The Intracoastal Waterway, Port Mansfield Channel, and Arroyo Colorado are about 15 feet (4.6 meters) deep; the Brownsville Ship Channel is about 40 feet (12.2 meters) deep.

Water-quality data (Table 9) were collected in September 1972 and May 1973.

The changes in line numbers to facilitate computer storage in the Texas Water Oriented Data Bank and to provide opportunity to coordinate data-collection sites among all agencies are shown below. New line numbers are used in Table 9 and on Figure 10.

All data collected prior to the changes in line numbers are stored in the data bank under the new line numbers.

Climatological Records

The climate of a region plays a great role in estuarine water quality. The types of climatological data available for a 60-mile- (97-kilometer-) wide band along the Texas coast are shown on Figure 11.

Tabulations of daily precipitation, temperature, and other data are published monthly, and monthly summaries are published annually by the Environmental Science Services Administration in the series titled Climatological Data-Texas. For the period 1931-60, monthly and annual data are summarized in two U.S. Weather Bureau publications (1958, 1965).

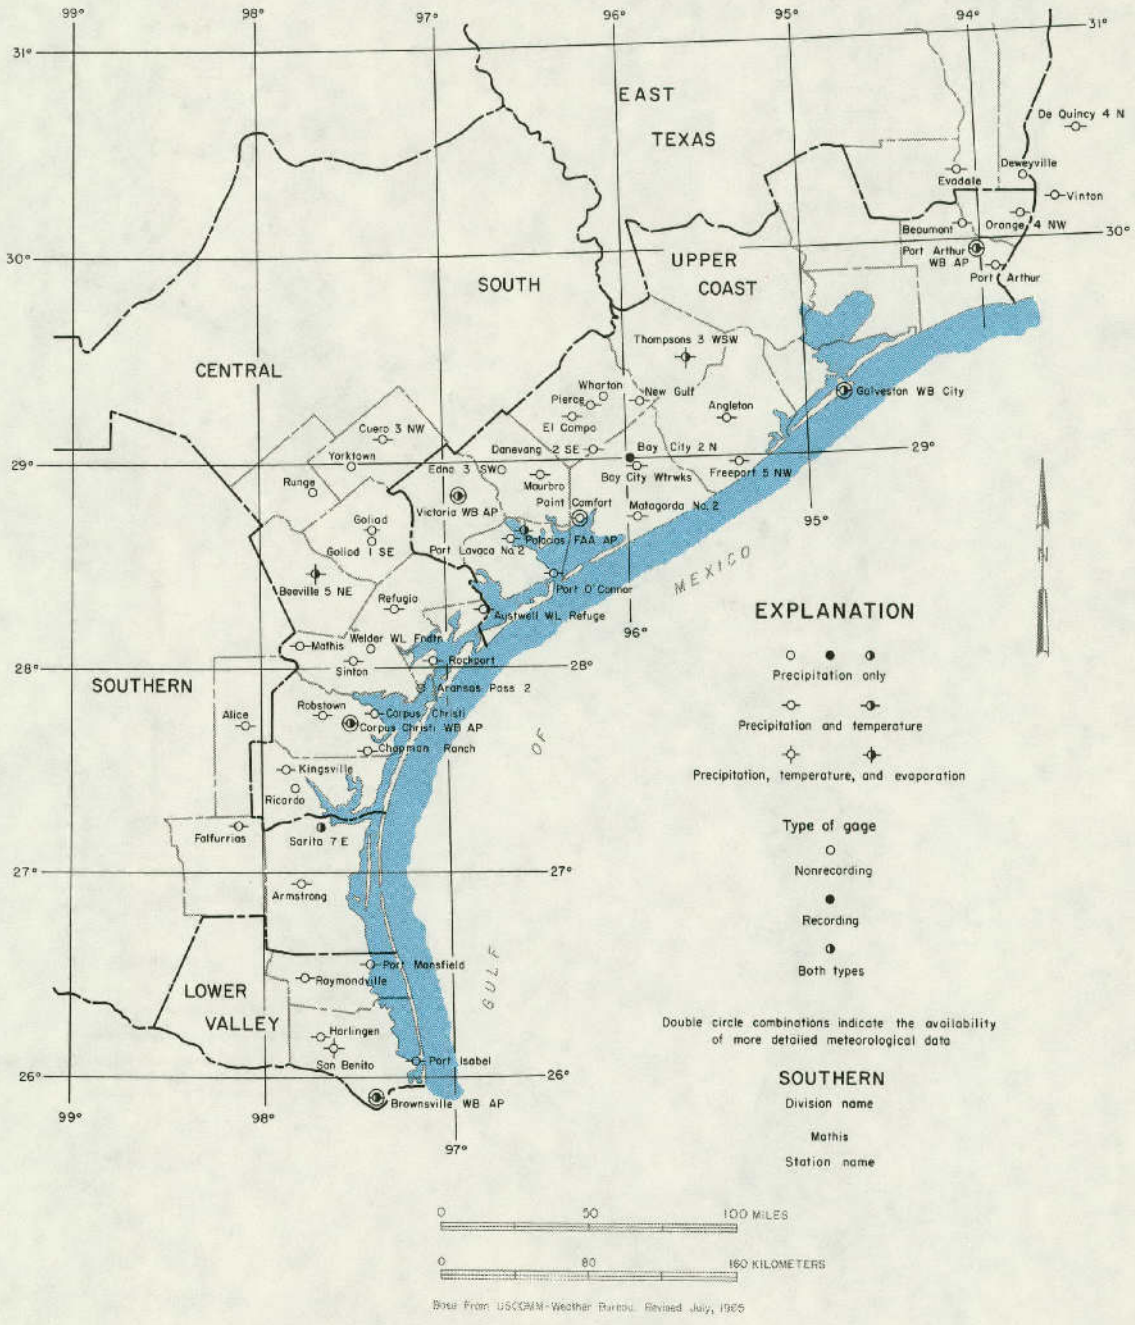

Figure 11.—Locations of Selected Climatological Stations

Streamflow and Water-Quality Records

Streams along the Texas coast lie in the flat coastal plain and are incised below sea level. Thus changes in water stage within bays often are reflected many miles up tributary streams. Consequently, the farthest downstream sites at which continuous streamflow data can be determined are located many miles upstream from the principal estuarine water bodies. The location of sites[1] at which continuous streamflow and daily water-quality data are available are shown on Figure 12.

The streamflow data for these sites represent runoff reaching the coastal area, but do not describe all

1 Station numbers greater than 400 are abbreviated from the U.S. Geological Survey numbering system. For example, the two station numbers 08041500 and 08162650, in abbreviated form become 415 and 1626.5.

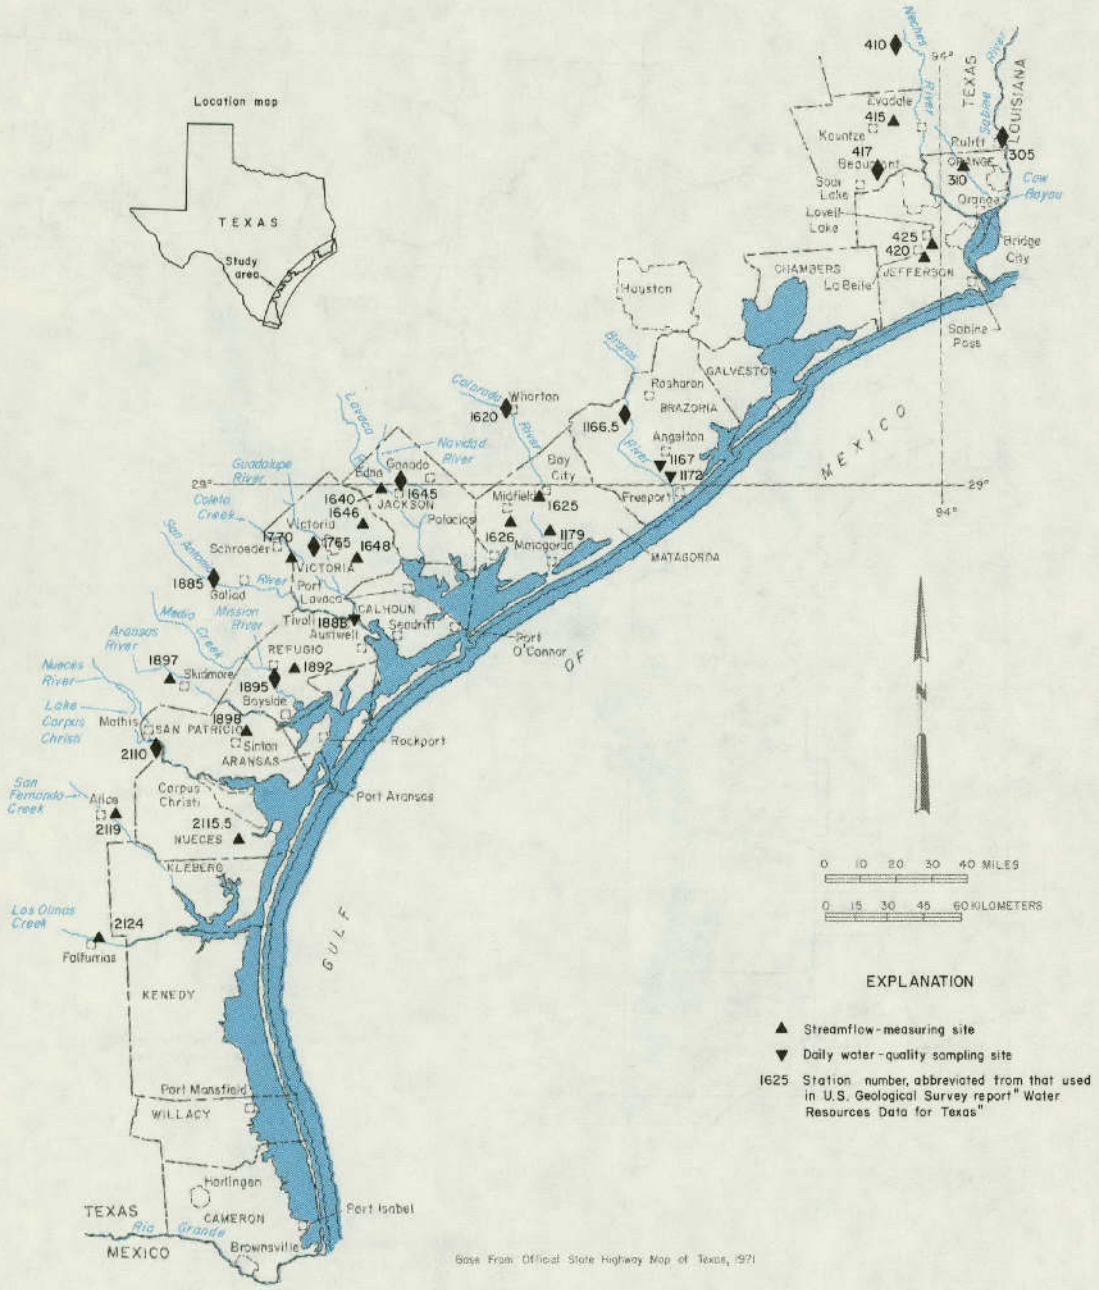

Figure 12.—Locations of Streamflow-Measuring Sites and Daily Water-Quality Data-Collection Sites

of the flow from streams that enter the estuaries. Intervening drainage, diversion for irrigation, return flows, and evapotranspiration may influence streamflow between the measuring sites and the estuaries.

Analyses of water collected daily at streamflow measuring sites show the effect of geology and cultural development on runoff from the drainage basins. At times, however, return flows, evapotranspiration, and lack of significant flow from upstream result in altered water quality between the data-collection site and the estuary.

Streamflow and chemical-quality data are published annually in the U.S. Geological Survey series Water Resources Data for Texas: Part 1, Surface-Water Records, and Part 2, Water-Quality Records.

Drainage areas from which unmeasured runoff enters the estuaries ranges from less than 100 square miles (259 square kilometers) on some estuaries to more than 10,000 square miles (25,900 square kilometers). Periodic measurements indicate that during some seasons unmeasured runoff that reaches the estuaries exceeds measured flow from the major tributaries.

To completely describe the quality and quantity of runoff from the entire area between continuous streamflow stations and the estuaries is not feasible; however, representative data are collected periodically at sites shown on Figure 13 and are published annually by the U.S. Geological Survey (1972, 1972a, 1973, 1973a).

Some of the sites are not sampled regularly and have no index number. These sites were numbered consecutively, from 1 through 27, for this report. The station names are listed below so the reader can identify them in the literature. The data from the 27 sites not previously published are listed in Table 10.

1. Little Robin Slough near Matagorda
2. West Branch Mad Island Slough near Collegeport
3. Unnamed tributary to Oyster Lake near Collegeport
