POLICY ANALYSIS QUESTIONS

- 1. What are the major priority concerns in Health Protection that are presently being addressed by your agency?
- What major programs and policies are being used to address these concerns?
- 3. What are the costs involved in implementation of these programs and how are they funded?
- 4. To what extent do you consider these efforts cost-effective?
- 5. To what extent have these efforts been successful in reducing factors, or the effects of such factors, which are detrimental to health?
- 6. What gaps and/or overlaps do you see among the various agencies involved in the area of Health Protection?
- 7. In you area of Health Protection, what new or additional concerns do you believe will need to be addressed in the future?

Introduction:

The Texas Behavioral Risk Factor Survey of 1982 revealed that certain behaviors which positively or negatively influence individual or community health status vary across the state according to age, sex, ethnicity and region. Of particular interest are data that relate to the five categories of objectives formulated by participants in the Texas Conference on Disease Prevention and Health Promotion: 1990 Objectives at their meeting in Austin in September, 1983. Following the objectives established at the national level, the workgroups on health promotion issues addressed the areas of smoking, misuse of alcohol and drugs, nutrition, physical fitness and exercise, and control of stress and violent behavior.

The excerpts from both the Texas Behavioral Risk Factor Survey and the Texas Conference on Disease Protection and Health Promotion: 1990 Objectives illustrate the state's involvement in health promotion and commitment to national goals in key public health areas. This highly abridged presentation of their findings and recommendations shows both the need for Health Promotion in Texas and exemplifies the health risks which local programs should be designed to reduce.

Smoking:

About 31% of Texans were smokers in 1982, a figure near the national average. Of those, 67% began smoking regularly before reaching age 20. Increasing numbers of smokers may be starting young. Of smokers 18 to 35 years old, 75% began the habit in their teens versus 48% of those who were 65 years old or older in the 1982 survey.

The conference recommended increasing health education about smoking at several levels. Reductions in the number of smokers by 50% were projected for those between 12 and 18 years of age and for pregnant women. In addition to a reduction in the number of adults who smoke, the 1990's objectives included a recommendation for increasing cigarette taxes and dedicating portions of the revenue to fund health promotion efforts. The role of state government in smoking education includes coordination and monitoring of program objectives, and training of professionals for health education activities.

Alcohol and drugs:

Programs to control the misuse of alcohol and drugs receive greater public funds than those related to smoking. The two problems are related; the Texas Risk Factor Survey found that increasingly heavy consumption of alcohol is associated with increased smoking. Of heavy drinkers, 49.4% were current smokers compared with 17.8% of those who do not drink. Among non-smokers, 83.7% abstain from alcohol or drink only lightly. With 11% of the state's population considered chronic heavy drinkers, Texas ranked fourth among 29 states surveyed.

High priority objectives for 1990 include reduction of problem drinkers in all

age groups as well as reduced per capita consumption of alcoholic beverages. Other goals focus on reduction of alcohol-related motor vehicle accidents in all age groups and efforts to influence adolescents to avoid using alcohol or drugs. Additionally, 90% was established as the target proportion for awareness of Fetal Alcohol Syndrome among women of childbearing age.

Nutrition:

Technically, malnutrition involves both over- and under-nourished individuals or groups. Among adults 18 years of age and older sampled in the Texas Risk Factor Survey, overnutrition is far more prevalent. 24% of all men in Texas were considered obese (based on weight for height), a proportion very close to average for all states surveyed (22.4%).

However, undernutrition and other nutrition related diseases occur among specific populations. The 1990's objectives target pregnant and lactating women, children and the elderly for education and assistance programs.

Physical fitness and exercise:

In 1982, 11% of Texas adults reported a sedentary lifestyle, based on a combination of answers to questions on active exercise, light exercise and daily physical activity.

State objectives for the 1990's include greater participation in fitness activities and assessments, adult and professional education, evaluation of school and worksite fitness programs, and targeting of women, minorities and the elderly for special consideration.

Stress and violent behavior:

Excessive stress entails negative social and/or health consequences. One half of survey respondents in Texas reported that they often or sometimes get upset, uptight, or irritable with those around them. Smoking or drinking in response to stress characterize 24% and 5%, respectively, of the state's male and female population. Excess eating under stress is typical of 30.9% of women and 14.7% of men. Another 17.5% of all adults say that they respond to stress by exercising, a coping mechanism with added health benefits.

Stress relates intimately to all other behavioral risk factors, from blood pressure to weight gain. However, society associates some behaviors affected by stress with social policy or the criminal justice system, rather than with health status. The 1990's objectives for Texas mark child and spouse abuse, rape, homicide and suicide for reduction. Other goals are a better understanding of the behavioral role of stress and greater incorporation of stress identification and treatment into the continuum of available health services.

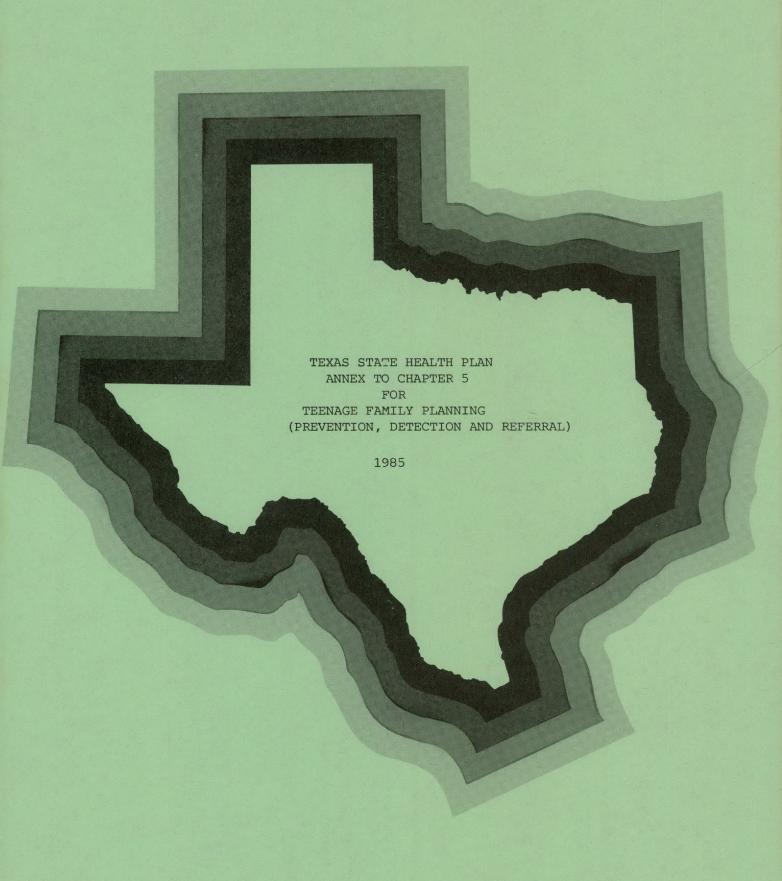

HEALTH PROMOTION - HEALTH EDUCATION EXHIBIT 1 LIST OF INTERESTED ORGANIZATIONS INTERVIEWED

HEALTH PROMOTION - HEALTH EDUCATION EXHIBIT 2 RANKING OF HEALTH PROMOTION CONCERNS BY MEDIAN RESPONSE

Question	Rank	Concern
6	1	The development of health education goals and objectives that are relevant to the needs of the community.
1	2	The cost effective placement of limited health promotion dollars.
11	3	The establishment of comprehensive school health curri- culum for pre-school through high school for all schools throughout Texas.
8	4	The lack of understanding that changes in lifestyle can produce a long-term return in investment of health dollars.
10	5	The need for cooperation rather than competition among health care providers.
7	6	The current level of public awareness regarding the benefits of healthy lifestyles.
13	7	A redistribution of monetary resources toward health promotion.
15	8	The availability of health programs for the elderly.
5	9	The availability of health promotion services for all socioeconomic groups.
14	10	The need for resources and strategies which have been proven effective in changing behaviors.
9	12	The current third party reimbursement system as it relates to organizations involved in health promotion efforts.
12	13	Data bases that identify behavioral health problems in Texas.
3	14	Providers' and consumers' need for a comprehensive listing of functioning health promotion services.
4	15	Many health promotion programs are aimed at groups that need it least.

ANNEX - CHAPTER 5: PREVENTION, DETECTION AND REFERRAL

Section One: Issue Referrals

As noted in the main body of the SHP, many major concerns surfaced in the area of Prevention, Detection and Referral. The prevention of unplanned pregnancies to teenagers was selected as the priority issue for this SHP and low birth weight babies has already been referred to specific agencies. The following listing indicates specific agencies and organizations that the other eight major concerns are referred to for continued work and development of action plans necessary to resolve these issues:

Concern

- creation of a comprehensive and coordinated data base that identifies high-risk groups and provides aicommon data source for human service agencies.
- Maintain interest and increase funding for the study of the incidence, distribution and control of chronic disease.
- The establishment of an environmental, occupational, and toxicologic studies division within the Texas Department of Health.
- Increase the funds for the expansion of the State's Cancer Registry Program to include hospitals in PH Regions currently not being served.
- Develop a coordinated program of continuing education in cancer management for primary care physicians in local communities.
- Promote the U.T. System Cancer Center as a resource service center for primary care physicians.
- The need for a Statewide Nutrition Education Program for grade school children.
- Income program funding to assure properly controlled water fluoridation to prevent the incidence of dental caries.

Proponent Organizations

Senate Bill 711 created the Health and Human Services Coordinating Council which is actively pursuing this issue and is being supported by all the related health and human services agencies.

Investigations are currently being conducted by Universities and Medical Schools across the State. This issue is specifically referred to the Center for Studies in Aging, North Texas State University and TDH, TDHR, and TDMHMR.

Specifically referred to TDH for further investigation.

This concern is referred to the Legislative Task Force on Cancer in Texas for review.

Referred to the state's medical schools and the above mentioned Task Force for design and development.

Legislative Task Force on Cancer and the U.T. System Cancer Center.

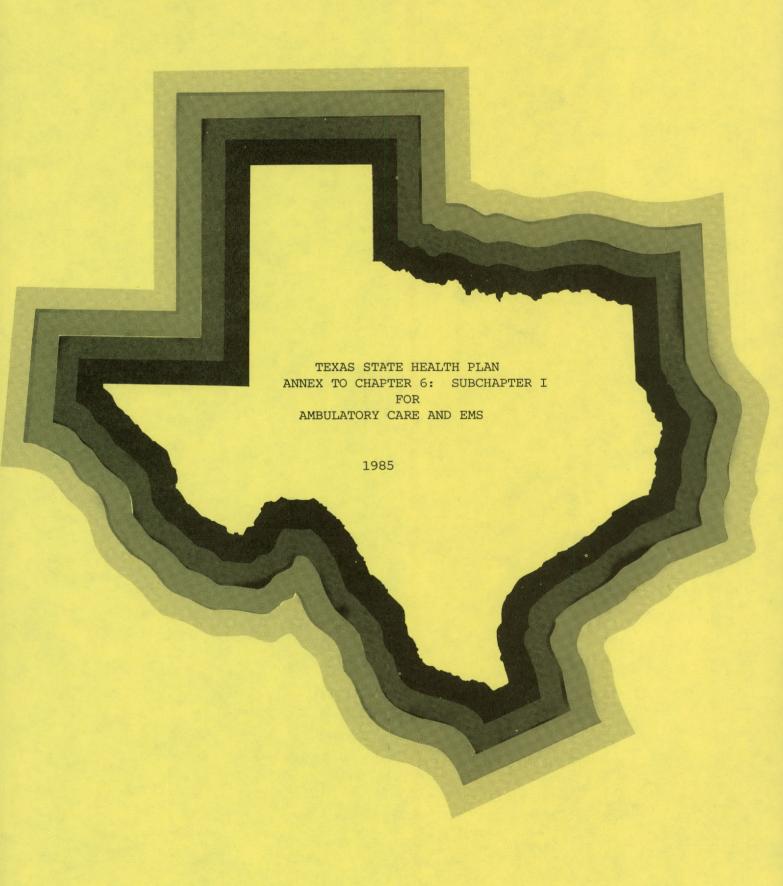

Referred to the Texas Education Agency, Texas Department of Health and Texas Department of Human Resources.

Texas Dental Association, Texas Department of Health.

Section Two: Background/Data - Teenage Pregnancy Prevention

The following reference documents provided valuable background information for the development of recommendations concerning teenage pregnancy and are available from the sources indicated:

- 1. Impact Evaluation of the Texas Department of Human Resources Family Planning Program, (May 1982), Malitz, Casper & Romberg, Source TDHR.
- 2. Final Report of the Select Committee on Teenage Pregnancy, (October 1982), Chairperson, Representative Mary Polk.
- 3. Proceedings of the Texas Conference on Disease Prevention and Health Promotion 1990 Objectives, (January 1984), Texas Department of Health.
- 4. An Exploratory Study of High-Risk Birth Factors and Family Self Support and Health Services In Relation to County Rates of Child Abuse and Neglect in Texas, (May 1982), Spearly and Whiting, Source TDHR.

ANNEX TO CHAPTER 6 SUBCHAPTER II - SHORT TERM INSTITUTIONAL CARE

Introduction The information in this Annex is intended to provide additional data and elaboration of Chapter 6, Subchapter II in the SHP. In addition, it includes a discussion of the major areas of concern, other than the #1 priority issue, which were recommended for referral by the SHCC to proponent organizations for appropriate action. Tables and exhibits which are referenced in and support Subchapter II are also included in this Annex.

Description As indicated in the SHP, there were 523 short term care hospitals in Texas in 1982 with 68,500 licensed beds. Collectively they provided 16.3 million patient days of care with an average daily census of 44,580. Of these 523 facilities, 325 (62%) were 100 or less beds in size, yet their workload comprised only 24% of total patient days. By contrast, only 18 hospitals with 500 or more beds (3%) provided 20% of total patient days. Of these 325 smaller hospitals, 213 (66%) were in rural areas. The number of short term hospitals has remained essentially constant since 1982. There were 524 short term hospitals as of February 29, 1984. A list of these 524 hospitals is included in this annex along with 1982 utilization data for the 523 hospitals operating in 1982.

Texas has a number of short term hospitals in multi-hospital systems. The Texas Hospital Association reported that in August 1983 there were 21 non-profit systems with 113 hospitals and 28 investor-owned systems with 171 hospitals. These figures indicate that 284 (58%) of the 492 short-term hospitals as classified by THA are system associated with 35% members of proprietary systems and 23% members of not-for-profit systems. Data regarding ownership status are presented in Table 1.

In dollar terms, total health care services and supply expenditures in Texas in 1982 reached \$15.3 billion. Hospital care expenditures totaled \$6.9 billion or 45% or total health care expenditures.

From any perspective, the hospital system in Texas is sizable; in fact, approximately one in every twelve hospitals in the United States is in Texas.

Major Concerns Referred to Proponent Organizations The second priority issue encouraged hospitals to develop alternative delivery systems to reduce costs and to increase accessibility to health care services. A related concern reflected in the prioritization survey related to a need to review existing alternative outpatient care programs. The purpose is to ensure their role is understood and compatible with the best interests of patients and the most effective operation of the health care delivery system overall. Any new methods of delivery which will reduce the need for or length of hospitalization merit thorough evaluation and encouragement. As noted in Subchapter II, there has already been a rapid proliferation of ambulatory surgery centers, so-called emergency care or ambulatory care centers, and home health agencies and programs in many parts of Texas and also an increased interest in swing beds. In many instances these programs are being developed by hospitals and in other instances by non-hospital based organizations.

[&]quot;Multi-Hospitals Systems in Texas, Trends and Developments," <u>Texas</u> Hospitals, September 1983, pp. 17-19, and telecon with THA representative May 7, 1984.

The primary problem when considering this issue is the current state of knowledge, or perhaps more correctly, the current lack of knowledge about these types of facilities in Texas. It is in many ways still a rather unstructured area particularly when considering data acquisition necessary for proper evaluation. A health planning initiative in this area is unquestionably needed, for example, a definitional and evaluation project perhaps via a special study effort. There are also major issues related to this area which will require careful consideration such as the potential need licensing of freestanding ambulatory surgical centers emergency/ambulatory care centers. The potential impact of the Medicare prospective pricing system is another area which will require close scrutiny. This system may tend to shorten hospital stays and thus require alternate delivery means to handle pre or post hospital care. Accordingly, this area is recommended for study and evaluation by the Texas Hospital Association (THA), Texas Medical Association (TMA), Texas Department of Human Resources (TDHR), Texas Department of Health (TDH), Texas Health Care Association (THCA), and related associations/agencies involved with alternate delivery care systems. Coordination of this effort should be accomplished by the SHPDA.

The overall cost of hospital care and methods to constrain increases is a subject of special interest in Chapter 8 of the SHP. As such it will only be considered here as it surfaced during the collection and prioritization of input related to this subchapter (see Item 1 on the Prioritization Survey). The input addressed cost containment issues submitted by respondents which represent ideas of differing orientation. For example, Certificate of Need (CON) is a regulatory program designed to address one aspect of cost control, basically capital expenditures. Conversely health care coalitions are generally voluntary initiatives intended to look at methods to control cost through negotiation with providers over price of services. Because of their perhaps inappropriate combination under the general thesis of cost control in the survey, the results may have been somewhat biased. For example, some groups could support CON and not coalitions and vice versa. In view of the lack of concensus regarding CON between the Federal administration and the Congress and the ill-defined status of health planning legislation, no current action is recommended on this topic at this time. Conversely health care coalitions and other means to control cost should continue to be evaluated. SHPDA staff is currently involved in reviewing this area. These efforts should continue and be augmented by coordination with TDHR, THA and private organizations involved with the development of this type of initiative.

Regionalization of high cost services and equipment has potential for savings and increased efficiency. It can best be initiated in a given area of specialty, e.g., perinatal services, rather than on a broader basis. Regionalization of specialized medical services is considered under the National Health Planning Guidelines (NHPG) in Chapter 9. It is recommended this be the primary emphasis in this area at this time.

Monitoring the impact of the Medicare prospective pricing system and DRG's, is already under active evaluation by TDHR. This process currently includes "modeling" efforts to evaluate the potential impact in this area. These efforts warrant referral to TDHR for continued action along with review of the reimbursement mechanisms used in private insurance programs for possible adaptation to state funded programs in Texas.

Recognizing the special roles of tertiary care centers in treatment, education and research and developing programs/mechanisms to assure adequate funding of these centers is another key issue to be considered in the overall picture of hospital reimbursement. This is particularly true with respect to reimbursement rates to such hospitals under the Medicare prospective pricing system currently being implemented. Resolution in this area is highly dependent upon Federal action vis-a-vis reimbursement mechanisms. Continued action in this area is probably best handled at this time between the professional associations involved and the federal authorities. If adequate resolution is not forthcoming, it could well be an area for a special study initiative.

One issue involved improving coordination in the inter-hospital transfer of indigent patients by developing some type of central coordination resource, preferably on an area basis, to ascertain bed availability and to foster an equitable distribution of such patients among area hospitals. Here again some aspects of this problem will be addressed in the consideration of priority issue number 1 developed in the SHP. To the extent they are not, the issue can probably best be addressed initially on a voluntary referral basis or through the COGs on a regional or local basis as appropriate. Other than as it may be addressed in priority issue number 1, it is recommended that no action be taken until a regional planning system is considered as previously mentioned in relation to the NHPG.

Reviewing the availability by geographic area of acute care beds for chronically ill, disabled and a growing population of elderly patients in an increasingly cost conscious hospital environment was another issue identified through the input process. This is basically an ongoing process within the SHPDA, but if the implementation of the DRG system does in fact pose problems in this area as some respondents believe, it could best be addressed at that time via a special study effort.

Developing programs to enhance the availability of organ donations and the financing of transplants was yet another identified concern. There is already a Governor's Task Force studying this area and no further action is now recommended pending the results of this effort.

There were two items which related primarily to the health professions area. One involved the existing or expected shortages of trained health professionals by specialty type and geographic area which support acute care hospitals. It recommended developing programs to resolve any identified shortages. The other item related to an alleged oversupply of specialty physicians in certain areas of Texas and an undersupply of primary care physicians in some areas. It recommended the critical assessment by Texas medical schools of the breadth of and emphasis on their specialty programs versus their primary care programs. Both of these items are health profession issues and although both are of considerable importance, they are best addressed in Chapter 8 in the Health Professions subchapter.

Another issue involved increasing the availability of podiatric care services in hospitals and enhancing means of cooperation to provide such care in hospitals. This issue should be referred to the professional associations involved, namely THA and the Texas Podiatry Association, for continued efforts toward mutual resolution.

Tables and exhibits in support of Subchapter II follow in the Annex.

SURVEY QUESTIONS FOR SHORT TERM INSTITUTIONAL CARE

(Community general and special hospital in-patient care provided in facilities which have an average length of stay under 30 days and are available to the general public).

- 1. What does your organization consider to be the major, most pervasive existing concerns in
 - the availability, delivery, reimbursement, etc. of short term institutional care and/or
 - (2) the operation, financing, modernization, etc. of facilities/equipment that warrant priority attention/resolution in a near to mid-term timeframe?*
- 2. What policies, programs, approaches does your or other organizations currently have to address these concerns?
- 3. As applicable, how are such programs funded and what costs and resource requirements are involved? Is current funding appropriate and if not, what changes are needed?
- 4. To what extent have these policies, programs, approaches been effective? Is there a need for improvement, and if so, in what manner?
- 5. If applicable, is there a need for improved coordination of activities between and among organizations involved in addressing these concerns? If so, in what manner or to what extent?
- 6. Does your organization recommend the development of new policies/programs or the use of new approaches to address these existing major concerns. If so, what courses of action are recommended, who should be involved, and what costs, resources requirements, constraints would likely be involved?
- 7. What results would your organization anticipate if these new policies, programs, approaches were implemented?
- 8. What new, major concerns, if any, does your organization believe will develop in the near future which will require attention via new or modified policies, programs, systems?*
- 9. How should those new concerns be addressed and what costs, resource requirements, constraints would likely be involved? Who best should address these new concerns?

^{*}It is recognized that there may be many vital concerns which should be addressed. It is suggested, however, that only those your organization considers to be of the highest priority, e.g., the top two or three most urgent concerns requiring resolution, be presented here for consideration by the SHCC in the development of the next State Health Plan.

PRIORITIZATION OF SHORT TERM INSTITUTIONAL CARE CONCERNS QUESTIONNAIRE

 Strengthening or developing local or state programs, e.g., Certificate of Need, health care coalitions, and like activities to further health care cost containment efforts, to include consideration of reimbursement rates/ mechanisms and the continued volume of capital expenditures.

CHAPTER 6

SUBCHAPTER III: LONG TERM INSTITUTIONAL CARE AND ALTERNATIVES

Summary of Analysis Results

Modern technology has tended to produce increased life expenciancy at birth and thus a high proportion of older persons in our population. Unfortunately, improved life expectancy has not ensured freedom from disease, impairment and disability, a part of the aging process. The knowledge of how to prolong life regretably has not brought with it the know-how to ensure personal independence for older persons.

Data has shown that the number of elderly and frail elderly (75 years and older), the primary users of long term care are increasing more rapidly than that of the population as a whole. As the elderly grow older, the progression of chronic disease and the aging process itself cause a decrease in abilities in the daily activities of living. Throughout this process, services and living arrangements should be available to the elderly to assist in maintaining optimal functions ability, in adjustment to chronic conditions and in maintaining personal dignity. The more appropriately the living environment supports the capabilities and needs of older individuals, the longer they will be able to maintain autonomous lives, and the higher quality these lives will be.

As elderly individuals lose the ability to care for themselves, the need for assistance from others increases. However, social changes such as more women in the work force, families with fewer children and family morbidity are reducing the amount of informal support care provided by the family. An increasing demand for formal support provided by paid employees of social services and health care organizations has developed and is expected to continue to increase. Therefore, a continuum of services which meet the needs of the elderly and disabled should be available. Services should provide these individuals with the needed care while allowing them as much freedom as possible to reduce the likelihood of premature placement in an institution.

For many years the major concern within long term care was the provision of medically oriented institutional services. In recent years the shift has been toward the development of a broad range of services which met varying degrees and types of needs of individuals and to reduce the premature admission of individuals into institutions. While the family continues to be the primary source of care for the elderly and disabled, various publicly funded services are being developed to provide for the social, personal and medical needs of the semidependent elderly and disabled. Such programs allow these individuals to avoid early placement in institutions and to remain within a less restrictive home and community setting.

In recent years, efforts to reduce the high cost of institutionalization have resulted in (1) the discontinuation of Intermediate Care Level II (custodial) care from the Medicaid program and (2) the development of several alternatives designed to assist the elderly and disabled to remain in their homes and community. The range of long term sevices includes in-home services, community-

based services, congregate living arrangements, supervised living and nursing home care. Review of current services available to the elderly and disabled indicates a gradually increasing array of service options, but there are still gaps in this continuum of services and gaps in the availability of services to all persons regardless of income levels.

There has been a rapid expansion in home health care and homemaker services in Texas. Table 1 indicates that there were 392 licensed home health agencies in Texas in 1982. These agencies provided 2,948,270 home visits. Review of the visits show that they were provided unevenly among the various state planning regions (SPR). In January 1984, there were over 700 licensed home health agencies. Determination of need for future services will need to be established based upon additional utilization data for 1983.

Table 2 illustrates the facilities licensed as adult day care and adult day health care facilities licensed as of January 1, 1984. The table indicates that the services are in short supply and unevenly distributed within the state. While other adult day care services exist, only facilities under contract to TDHR are required to obtain a license.

Nutritional programs include home-delivered meals (meals-on-wheels) and congregate meals. The 28 Area Agencies on Aging under the Older Americans Act, provide nutritional services at 831 sites. TDHR also provides nutritional services under Title XX.

Personal care homes and the number of beds available have increased. During 1983, an estimated 787 nursing home beds were converted to personal care beds. Table 3 shows that there were 2,462 licensed personal care beds on January 1, 1984. The table shows that 1356 of these beds were located in wings of 50 nursing homes with 1106 beds in 23 freestanding personal care homes. Five SPRs are without personal care beds. The need for additional personal care beds is illustrated by the selection of this concern as the key issue to be developed in the SHP. Also, personal care homes which provide services mainly for the mentally retarded need to be separated from those which provide services for the elderly.

The TDHR is currently providing state funds for the reimbursement for 406 clients under a supervised living program as illustrated in Table 4. The beds in the program are licensed as personal care or custodial care beds.

While the number of licensed custodial beds has rapidly decreased since Medicaid reimbursement was discontinued except for clients "grandfathered" in, there remained 1188 on January 1, 1984. Table 5 shows the SPR location of these beds. Fifteen SPRs were without custodial beds on January 1, 1984. Custodial beds are included with nursing home beds in the bed projections included in Chapter 9. Table 5 also illustrates the Medicare-Medicaid certification of nursing and custodial beds and presents a beds per population 65 years and older ratio for each SPR. Only 1.2% of the licensed nursing-custodial beds were custodial beds.

Identification of Key Issue

In order to identify major concerns of long term care, 41 state agencies, state associations and other organizations and the executive directors of the 24 Coun-

cils of Government (COG) were contacted by mail and requested to assign a contact person to assist the SHPDA staff in identifying major concerns. Exhibit lists the organizations contacted. The organizations which assigned a contact person are also indicated.

Two survey instruments were prepared and mailed to these assigned contact persons. Organizations from which a response was received are also indicated on Exhibit 1. Exhibit 2 is an example of the survey form mailed to state agencies which were determined to have a key role in the long term care delivery system. Exhibit 3 is an example of the survey form mailed to all other assigned contact persons.

The responses to the survey forms together with SHPDA staff analysis of literature, 12 HSPs, the SHP and the programs of the various agencies were used to develop the list of major concerns listed in the SHP. A prioritization questionnaire was developed from this list of major concerns and is included as Exhibit 4. This questionnaire was mailed to the local agencies listed as "Questionnaire Respondents on Exhibit 1." The items included on the questionnaire were scored and the issues receiving the highest scores were discussed with TDHR, TDoA, and the Bureau of Long Term Care of TDH. Three key issues were identified.

The three key issues together with a short background were presented to the SHCC for selection of the issue to be addressed in the SHP. Exhibit 5 presents the issues and backgrounds as referred to the SHCC. Issue C was selected for inclusion in the SHP.

Major Concerns Referred to Proponent Organizations

Priority issue A concerning the reimbursement of long term care services and the containment of cost is referred to TDHR. As administrator of Medicaid and Title XX federal funds, TDHR must budget state and federal funds which provide medical and socio-economic aid to the indigent elderly and disabled. TDHR is the proponent agency assigned by the legislature to develop a continuum of long term care services to meet the needs of the elderly and disabled. The department publishes standards for financial eligibility and medical eligibility determinations and is responsible for care planning and case management. TDHR should continue to research methods as the channeling program, for providing needed care to the elderly in the most cost efficient/least restrictive manner. TDHR should continue to research methods of reimbursement for care, such as Service Mix Reimbursement (reimbursement of nursing facilities on the basis of average service mix per facility) and prospective payment (payment based on diagnostic groups).

Priority issue B concerning private insurance coverage of long term care services is referred to the State Board of Insurance. Medicare provides important but limited home health care services but was not designed to address long term care needs. Medicaid provides reimbursement for nursing home care and some in-home and community services for the indigent. Title XX provides social services for the indigent. Elderly and disabled who cannot afford to pay for in-home long term care services have often been forced to enter a nursing home in order to receive services. Individuals with limited resources who enter a nursing home must "spend down" these resources before becoming eligible for

Medicaid assistance. Insurance policies should be developed to provide long term care services for the elderly and disabled.

While the development of this issue may not have an affect upon the long term care system in the next few years, it could greatly effect the system as individuals born in the "baby boom" years become elderly. The ever-increasing number of elderly and frail elderly will create a demand for long term care services which will not be met through public assistance programs. Therefore, problems of providing long term care insurance should be studied and plans should be developed to initiate coverage. Major medical health care coverage policies should not be cancelled for persons reaching age 65 or those who have been diagnosed with a chronic illness or condition.

Other major concerns identified through policy analysis and survey of state agencies, organizations, and others are listed in the SHP. These concerns are identified by number and recommended for referral as follows:

Item 3 concerning where and how to spend limited Medicaid and Title XX funds is referred to TDHR. (See referral of Priority Issue 1 for discussion).

Item 4 concerning the development of a methodology to project future needs for nursing home beds is addressed in Chapter 9. SHPDA staff should continue to collect data needed to allow projection for specific levels of bed need, i.e., skilled, ICF, custodial and personal care levels. The effect of initiation of diagnostic related group remibursement in hospitals should be monitored and included in determination of future needs.

Item 5 concerning gaps in the continuum of long term care services is referred to TDHR, TDMHMR, TDoA and TDH as follows:

- (a) Mental health problems of the elderly and disabled are referred to TDMHMR. Nursing home administrators and families providing in-home care for the elderly and disabled should be assisted in understanding and dealing with individuals with Alzheimer's and senile dementia. Mental health needs of the elderly and disabled should be integrated into the total treatment program for these individuals, a "holistic" approach. (See Chapter 8, Subchapter VI, Mental Health for discussion of Mental Health issues.) Need for assistance in reimbursment for dental care for the indigent elderly and disabled is referred to TDHR. Determining the need for additional nutritional services, both in-home and congregate meals, is referred to TDHR and TDOA.
- (b) The need for additional adult day care, adult day health care, in home and community respite services, in-home attendant care services and transportation services is referred to TDHR. These services are essential services needed to assist the elderly and disabled to remain in their own homes, in homes of family members and in foster homes. TDHR should continue its efforts to determine the need for these services, the costs of providing these services to the indigent and methods of reimbursing providers for these services. Medicaid and Title XX reimbursed providers should be encouraged to expand services to include individuals who are financially able to purchase these services.
- (c) The need for additional home health care services and hospice services are referred to TDHR and TDH. TDH, in conjunction with TDHR, should first determine

and then collect the data necessary to project the future need for these services. Providers should be encouraged to expand services to include individuals who are financially able to purchase these services. The effect of adding hospice service for reimbursement under the Medicare program should be studied.

Item 6 concerning the problems of access to services due to fragmentation of the delivery system is referred to the Health and Human Resources Coordinating Council (HHRCC), TDHR, TDoA, TDMHMR and TDH. State programs which provide long term care services to the elderly and disabled which are funded by federal dollars are restricted as to the services that can be reimbursed by the various programs. These programs are disbursed among the various state agencies. These factors have created overlaps and gaps in services. The elderly and disabled who need these services often lack knowledge of available services and/or must apply to more than one agency or various programs within an agency to receive The HHRCC should work with the various state agencies to needed services. coordinate long term care services. TDHR should continue its efforts to standardize eligibility requirements, develop a more comprehensive case management system and utilize client need assessment instruments which can be used in the various program it administers.

Item 7 concerning the maintenance and improvement of the quality of long term care is referred to TDoA, the 28 AAA, TDHR, TDMHMR and TDH. TDoA and the 28 AAAs should continue to provide and further develop ombudsman services and information and referral services under the Older Americans Act. TDH should review and update operating and licensing standards for nursing home, custodial homes, personal care homes, home health agencies, and adult day health care agencies. TDMHMR should insure that mental health services are provided for the elderly. TDHR should continue the development of a continuum of long term care alternatives to institutionalization. The effect of Senate Bill 67 which provides reimbursement for long term care for the artistic should be studied.

Item 8 concerning the supply and distribution of professional and support staff trained to provide geriatric care is referred to the Texas College and University System Coordinating Board, Texas medical schools and Texas schools of nursing. Medical schools should offer additional courses in geriatrics and physicians and nurses should be encouraged to specialize in this area. TDHR and TDH should continue to study staffing requirements for long term care facilities. TDHR and TDH should research methods for reduction of turnover rate of attendants and aides in nursing homes. Factors to be considered include low salaries, burnout factor and poor training.

*Visits provided by agencies with offices in a SPR and visits within a SPR do not equal since agencies are licensed to provide visits in counties other than county where office is located. Visits are provided in counties without offices and often provided in counties outside the SPR.

Source: 1982 Integrated Facilities File, TDH

^{**}The total statewide visits in the column headed "Visits provided by licensed agencies in an SPR" represents the total home health visits accomplished in the state. It does not agree with the column headed "Visits within an SPR" because the county where the visit was provided was not always indicated on the annual TDH questionnaires.

SURVEY FORM OF MAJOR STATE AGENCIES LONG-TERM INSTITUTIONAL CARE AND ALTERNATIVES

CURRENT STATUS

- 1. What are the major priority concerns in long-term care that are presently being addressed by your agency?
- 2. What major programs and policies are being used to address these concerns?
- 3. What are the costs involved in implementation of these programs and how are they funded?
- 4. To what extent do you consider these efforts cost-effective?
- 5. To what extent do you consider these efforts to be successful in meeting the needs of long-term care recipients?
- 6. Do you believe that gaps and/or overlaps in services exist among the various agencies involved in the delivery/reimbursement of long-term care? If so, please identify them.
- 7. What recommendations do you have for developing improved coordination between your agency and other departments and agencies where this may be indicated?

FUTURE CONCERNS

- What new or additional long-term care concerns do you believe will need to be addressed in the future?
- What new programs and/or policies would you recommend for addressing these future concerns? Please explain why you consider these new programs and/or policies necessary.
- 3. What shifting of current federal and/or state funding or new sources of revenue would you suggest to finance these new programs and/or policies?
- 4. What constraints will likely be experienced when trying to implement these programs and/or policies?
- 5. To what extent do you believe these new programs and/or policies can be made cost-effective?
- 6. What methods would you use to evaluate the effectiveness of these new programs and/or policies?
- 7. What do you predict as the results of implementation of these new programs and/or policies, i.e., how will they benefit the recipients?
- 8. To what extent do you believe that enough flexibility can be built into the new programs and/or policies to take care of unanticipated problems?
- 9. In your opinion, if no changes are made in current programs and policies, to what extent will they meet future long-term care needs?
 - Note: 1. Please provide available data to substantiate your answers to any of the above questions, i.e., facilities, clients, funding, manpower, utilization, distribution, and demand.
 - Please briefly describe the method of data collection and management your agency is presently using.

SURVEY FORM FOR OTHER STATE AGENCIES, ASSOCIATIONS AND ORGANIZATIONS LONG TERM INSTITUTIONAL CARE AND ALTERNATIVES

CURRENT STATUS

- 1. What do you consider to be the major concerns involved in the delivery/ reimbursement of long term care in Texas?
- 2. What methods are you using or do you recommend to be used in addressing these concerns?
- 3. What costs do you anticipate will be involved in addressing these concerns and how should they be funded?
- 4. To what extent do you consider existing programs and services to be successful in meeting the needs of persons in need of long-term care?
- 5. Do you believe that gaps and/or overlaps in services exist among the various agencies involved in the delivery/reimbursement of long-term care? If so, please identify them.
- 6. What recommendations do you have for developing improved coordination among the various agencies involved in the delivery/reimbursement of long-term care where this may be indicated?

FUTURE CONCERNS

- 1. What new or additional long-term care concerns do you believe will need to be addressed in the future?
- 2. What new programs and/or policies would you recommend for addressing these future concerns? Please explain why you consider these new services and/or policies necessary.
- 3. What shifting of current federal and/or state funding or new sources of revenue would you suggest to finance these new programs and/or policies?
- 4. What constraints will likely be experienced when trying to implement these programs and/or policies?
- 5. What methods would you use to evaluate the effectiveness of these new programs and/or policies?
- 6. In your opinion, if no changes are made in current programs and policies, to what extent will they meet future long-term care needs?

PRIORITIZATION OF LONG TERM INSTITUTIONAL CARE AND ALTERNATIVE SERVICES CONCERNS QUESTIONNAIRE

1. Factors such as the rapid rise in costs of care, the capping of Federal medicaid funds and the expanding number of the frail elderly indicate that public funding for long term care for the indigent elderly and the disabled will probably be inadequate to meet future needs. Therefore, methods for providing additional funds combined with methods for reducing the costs of care need to be developed and implemented.

very highhighmoderatelowvery lowconcernconcernconcernconcern

2. The Medicaid Program should allow provision of care most appropriate to a patient's individual needs and the program should be expanded to include reimbursement for additional home and community services, community inpatient care for the mentally ill, social services and assistance to families caring for the elderly or disabled in the home. Accordingly, coverage under the Medicaid Program should be reevaluated to determine whether an expansion of the system is advisable.

very high
concernhigh
concernmoderate
concernlow
concernvery low
concern

3. The Medicaid nursing home reimbursement rate structure which has only two levels of care, i.e., skilled and intermediate may not reimburse providers directly in proportion to the individual care needs of a patient. A weighted cost reimbursement system or a schedule similar to the diagnostic related group system for hospitals should be developed and implemented for nursing homes and facilities for intermediate care mentally retarded V and VI patients.

very high
concernhigh
concernmoderate
concernlow
concernvery low
concern

- 4. Private insurance which provides long term care benefits for the elderly is limited in Texas. Therefore:
 - A. Private insurance companies should be encouraged to develop and offer new policies and riders to existing policies to cover long term care services.

very highhighmoderatelowvery lowconcernconcernconcernconcern

B. The State should investigate the possibility of state insurance or subsidies to private companies for long term care coverage.

very highhighmoderatelowvery lowconcernconcernconcernconcern

EXHIBIT 4 - PAGE 2

PRIORITIZATION OF LONG TERM INSTITUTIONAL CARE AND ALTERNATIVE SERVICES CONCERNS QUESTIONNAIRE

5. Population projections indicate a rapid expansion in the 65 and over population, the prime users of long term care facilities and services. Accordingly, methodologies need to be improved/developed to better project the need for skilled, intermediate care and personal care beds and they should include consideration of additional factors such as the impact of home health services, the implementation of the Medicare Diagnostic Related Group (DRG) Reimbursement System in hospitals and requirements for modernization/replacement of existing facilities.

PRIORITY ISSUES PRESENTED TO THE STATEWIDE HEALTH COORDINATING COUNCIL

Priority Issue 1

Factors such as the rapid rise in costs of care, the capping of Federal Medicaid funds and the expanding number of frail elderly indicate that public funding for long term care for the indigent elderly and the disabled will probably be inadequate to meet future needs. Therefore, methods for providing additional funds combined with methods for reducing the costs of care need to be developed and implemented.

Background

Currently, there are approximately 1.4 million Texans sixty-five and over, the prime users of long term care facilities and services. The Texas Department of Human Resources (TDHR) estimated that about 200,000 of this population are qualified both physically and financially for medicaid assistance. However, about 30,000 aged individuals are currently being served by TDHR. Population projections indicate a rapid expansion of this population and the sub-population of frail elderly (75+) within the next decade. It is predicted that this increasing population will create a demand for increased services. The capping of Federal medical funds and more costly services caused by inflation will create a greater demand upon the state to provide funding for indigent care. Methods to provide more efficient delivery of services and methods for locating additional funds need to be developed in order that future demand for services will be met.

Priority Issue 2

Individuals with physical or mental impairments must receive long term care services on a recurring or continuous basis. These services place a continuous drain upon personal income resources of the aged and disabled. Private insurance companies should be encouraged to develop and offer new policies and riders to existing policies to cover long term care services.

Background

Representatives of TDHR indicate that approximately 80% of nursing home care is financed by Medicaid dollars. Many elderly individuals enter nursing homes as private pay clients, but eventually exhaust their resources and become eligible for Medicaid assistance. Home health care and community care are Medicare and Medicaid oriented and often exclude private pay individuals. Development of insurance policies to provide coverage for long term care services would protect the personal resources of institutionalized individuals, reduce the number of individuals whose care is reimbursed by Medicaid and encourage community and home care providers to expand services to private pay and insured individuals.

EXHIBIT 5 - PAGE 2

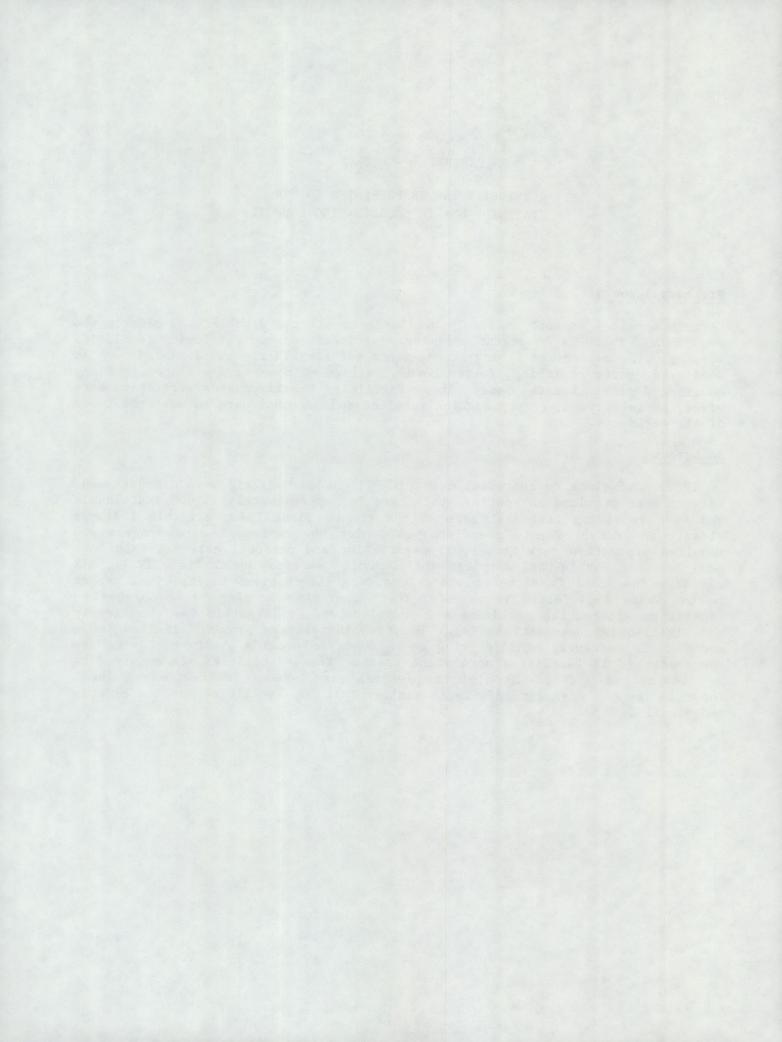

PRIORITY ISSUES PRESENTED TO THE STATEWIDE HEALTH COORDINATING COUNCIL

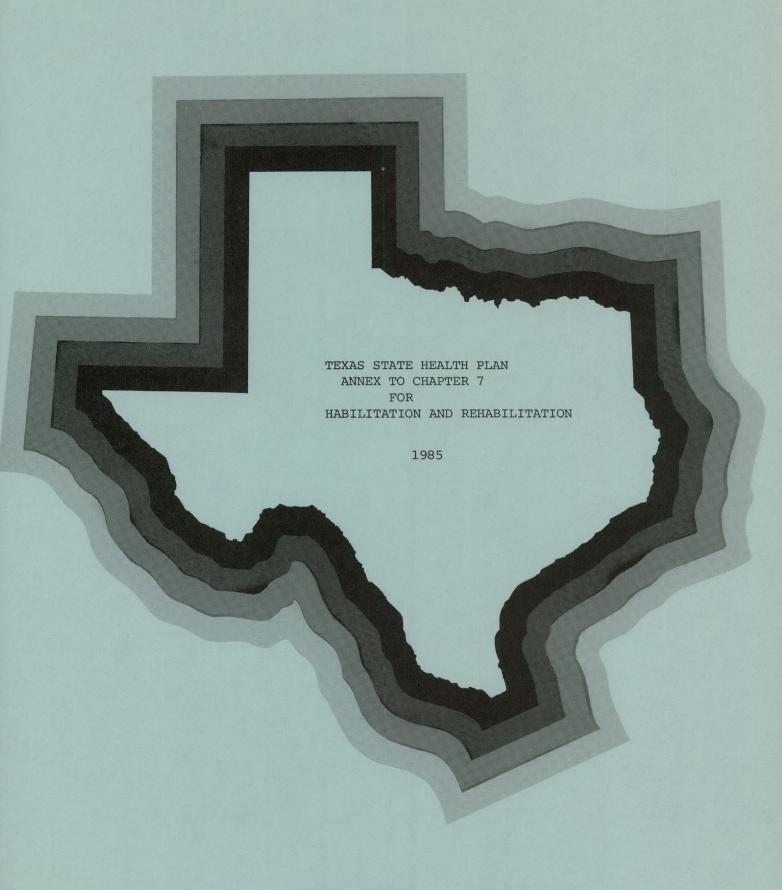

Priority Issue 3

Certain services are not uniformly available to all the disabled and elderly who need them. There is an urgent need for additional non-medical living facilities which provide supervised living arrangements for the elderly and disabled such as sheltered apartment living, foster homes, retirement homes and villages, halfway houses and personal care homes. These facilities should provide protective services, socialization, transportation services and personal care to meet the needs of the residents.

Background

In 1980, admissions to custodial care (ICF-II) under Medicaid were discontinued. Waivers were provided to continue this care for approximately 15,000 individuals who were receiving custodial care at the time. Since 1980, eligible indigent elderly and disabled not "grandfathered" under the custodial care program who required protective nutritional, transportation and personal care services have been provided for in-home services and community services under Title XVIII, XIX and XX. The Joint Committee on Long Term Care Alternatives in its final report to the Texas Legislature recommended that congregate housing be encouraged to provide an alternative residence and semi-independent lifestyle for the elderly and disabled (Recommendations #4). The 68th legislature provided limited funds and TDHR is currently administering these funds to provide sheltered living arrangements in 13 facilities across the state. These facilities are required to be licensed as either custodial or personal care homes. Statewide and local input indicate a need for additional sheltered living facilities for the elderly and disabled.

CHAPTER 7: HABILITATION AND REHABILITATION

POLICY ANALYSIS

DESCRIPTION

In order to understand better the services offered in H&R and the need for such services, we should explore the meaning of 'disability'. A human disability is any limitation of physical, mental or social acitivity of an individual as compared with other individuals of similar age, sex and occupation. It frequently refers to limitation of the usual or major activities, most commonly vocational. There are varying types of disabilities: functional; vocational; learning; mental illness; emotional disorders; and degrees: partial or total; and durations: temporary or permanent. This concept speaks to the limitation itself, whereas the term 'handicap' denotes the difficulty of achievement in overcoming the disability.

It can readily be seen that special treatment services involving and combining medical care, psychological and psychiatric treatment and the teaching of skills are sorely needed to assist disabled individuals. H&R services do offer that assistance.

Rehabilitation is the combined and coordinated use of medical, social, educational and vocational measures for training or retraining individuals disabled by disease or injury to the highest level of functional ablity. Habilitation is used for similar activities undertaken for individuals born with limited functional ability, as compared with people who have lost abilities because of disease or injury.

The disabling conditions are varied, complex, large in number and frequently occur in multiples, rather than singly, which compounds the task of the service providers. The services are, therefore, varied, complex, numerous and, ideally, should be delivered in a planned, combined and coordinated manner where patient multiple needs exist.

The disabling conditions include, but are not limited to the following: alcoholism, alzheimer's disease, cystic fibrosis, arthritis, autism, cancer, cardio-vascular conditions, cerebral palsy, deafness and hearing impairments, down's syndrome, drug abuse, emotional disturbances, epilepsy, head injury, learning disabilities, legal definitions of handicapping conditions, mental retardation, multiple sclerosis, muscular dystrophy, physical disabilities and special health problems, severe handicaps, speech and language impairments, spina bifida, spinal cord injury, and visual impairment.

We have not added categories on family violence, venereal diseases and motor vehicle mayhem but they do exist in large numbers and require extensive rehabilitative care.

From such a list, four things are readily apparent: these conditions can and do occur in multiples; these conditions generate sufficient physical and emotional pain and distress to overwhelm the disabled person; the needs of the disabled, both in terms of individualized services and caring professions, are sufficient

to overwhelm the H&R services delivery system; and there is a lack of incidence/prevalence rates for these disabling conditions. Exhibit 4 has been prepared listing those disabling conditions for which we could locate current prevalence rates, some national and some for Texas, with sources cited.

In the interest of reducing the scope of this study to a size more easily understood, we have excluded an inventory of those medical services needed for long-term physical disabilities. Such treatment is on the tertiary level and is not within the category of primary medical care services. The same exclusion is applied for those mental and emotional disabilities which require long term institutionalization. These services are essential for the rehabilitation of those severely disabled persons in need of extensive medical, surgical and psychiatric treatment, but there does exist a fairly elaborate system of facilities and trained staff to handle these situations. They may or may not be adequate, but that question must be answered at a later date in another study.

The great majority of the disabled persons in Texas are those with conditions which can be treated in community outpatient service settings, whether in a hospital or a freestanding clinic. These are the people who require an increased number and diversity of outpatient services in their rural communities, or at the very least, some practical means of accessing those services they need, even if they are one or two counties away.

Table 2 lists the 1982 inventory of the hospitals and freestanding clinics in each state planning region (SPR) which offers outpatient H&R services. This Table also lists the 1985 estimates for the number of disabled persons excluding age 65 and over, the number of 65 and over disabled, the grand total of disabled persons, the 1989 estimates for total disabled persons, and the state totals for the facilities and numbers of disabled persons.

The H&R outpatient services offered in these facilities are limited to audio therapy, medical evaluation, medical supervision, occupational therapy, physical therapy, prosthetics, psychiatric, psychological evaluation, recreational therapy, social case work, social evaluation, speech therapy, and vocational services. These services are not offered in a full array in each outpatient facility, the rule being only one or two such services except in the larger hospital facilities where space, equipment and trained staff are available. The most commonly offered outpatient services are: audio therapy, physical therapy; and speech therapy.

The communities have very little to offer in the way of sheltered workshops; education to reduce dependency like living skills, recreation and coping with architectural barriers, prosthetics, orthotics, employment placement services, community housing, manpower training, whether professional or volunteer, and the extended services such as tele-communications, library, Client Assistance Projects (CAPS), Community Alternative Service Systems (CASS) which are for the developmentally disabled and respite care for the families of the disabled.

There is a great and growing need for community level outpatient services for disabled persons. As the federal government withdraws it financial support, there is a great challenge for community leaders. As the federal money disappears, so does the political power which returns to the communities and the state the power to tackle problems and create change at the local level. The federal restraints will fade away and a large number of problems can be solved

at the local level with a lot less money. There must be an appreciation of future trends and a willingness to focus efforts for change and progress at the local and state levels if problems are to be solved.

The future trends show that the number of disabled persons is increasing, that too few outpatient H&R services exist, that the services must be publicized to both the disasbled and the providers, and that the services must be made accessible to those in need. All of these needs can be met if there is a willingness on the part of the state and local leaders to act in concert and cooperation. The most pervasive problems will yield to such efforts.

Major Concern Referred to Proponent Organizations The second concern selected by the Statewide Health Coordinating Council (SHCC) to be referred to those state agencies and proponent organizations is the need for increased community level outpatient H&R services. It can be seen from the H&R narrative section that a real need for additional services does exist.

The available data does not aid in identifying the specific services needed in a specific town, city, or county. As the implementors move to establish the transportation system described under the first priority, the non-profit corporations which will operate the transportation system will collect information and data on its medical care riders. That information will include the disabling condition/s, residence, location of outpatient service attended, and an outreach publicity and education program. All of this information will be sent to the 'Texas Transportation Agency' for transmittal to the state and federal agencies for a determination of its eligible client population in the rural counties of the state.

As this process moves forward, the state and federal agencies will be able to identify the disabled by their location, condition, services used, and the needed services. The gaps in services can be determined and where the transportation system does not provide the means of accessing the needed services, then, and only then, can the responsible state and local agencies undertake to establish and offer the needed H&R outpatient services.

The need for manpower training must be planned for by the various training schools, colleges and universities, based on shared information from the state and local agencies.

Those same state agencies which will be joined together in the 'Texas Transportation Agency' solution to the first priority are the primary implementing agencies in this second priority. They are the Texas Department of Health (TDH), Texas Rehabilitation Commission (TRC), Texas Youth Commission (TYC), Texas Department of Mental Health and Mental Retardation (TDMHMR), Texas Commission for the Deaf (TCD), Texas Department of Human Resources (TDHR), Texas Commission for the Blind (TCB), Texas Commission on Alcoholism (TCA), Texas Department on Aging (TDoA), Texas Department of Community Affairs (TDCA) and the Texas Education Agency (TEA).

It is true that this is primarily a medical services function, but coordination in the joint use of facilities and the coordinated location of jointly rented facilities, will have a major impact on reducing the initial costs of establishing new outpatient services. The agencies are urged to work closely together and with the communities in order to supply the needed services at the most reasonable cost.

The SPRs identified under the first priority are included as principal planners and leaders in the community process of implementation. These are the areas with the largest number of counties without any H&R outpatient services and/or with large numbers of disabled persons and will, in all probability, be those areas identified for the creation of new outpatient services.

EXHIBIT 1 INTERESTED PARTIES CONTACTED

The following agencies and organizations were contacted and their assistance is noted and appreciated:

Texas Commission on Alcoholism State Commission for the Blind Texas Commission for the Deaf Texas Department of Health - Spec. Hlth. Svcs. 65th LEGISLATURE-REGULAR SESSION

SCHOOL BUSES - USE FOR NONSCHOOL ACTIVITIES

CHAPTER 864

H.B. No. 884

An Act relating to the use of school buses for nonschool activities; amending Section 16.204, Texas Education Code, as added.

Be it enacted by the Legislature of the State of Texas: Section 1. Section 16.204. Texas Education Code, as added, is amended(35) to read as follows:

"Sec. 16.204. Use of Buses for Extracurricular Activities, Etc.
"(a) The county school boards and the state commission of education shall promulgate regulations in regard to the use of school buses, for other than transporting eligible children to and from school. Under rules and regulations of the State Board of Education, the appropriate district allocation in the county transportation fund, when approved by the county school board, or the district transportation fund, when approved by the board of trustees of the independent school district operating its own transportation system, may be used for school bus transportation of its pupils and necessary personnel on extracurricular activities and field trips sponsored by the respective district.

"(b) Subject to the rules of the commissioner of education, a school district or county school board governing a countywide transportation system may contract with governmental agencies or nonprofit organizations for the use of school buses for the transportation of senior citizens or handicapped persons."

Sec. 2. The importance of this legislation and the crowded condition of the calendars in both houses create an emergency and an imperative public necessity that the constitutional rule requiring bills to be read on three several days in each house be suspended, and this rule is hereby suspended, and that this Act take effect and be in force from and after its passage, and it is so enacted.

Passed by the House on May 13, 1977, by a non-record vote; passed by the Senate on May 27, 1977: Yeas 32, Nays 0.
Approved June 17, 1977.

Effective Aug. 29, 1977, 90 days after date of adjournment.

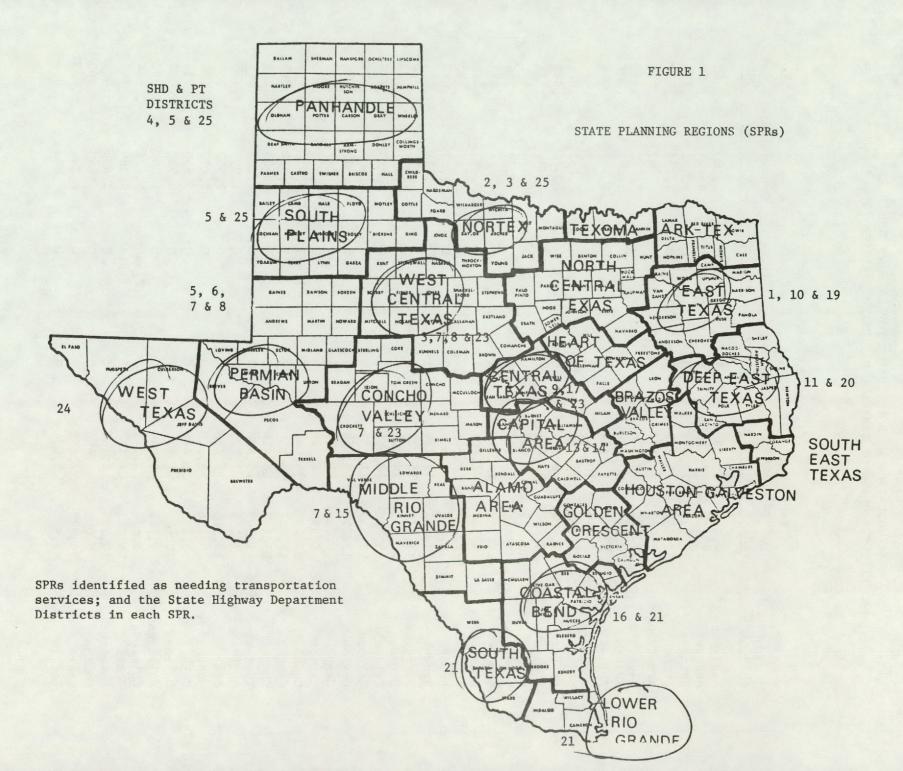

(35) V.T.C.A. Education Code. - 16.204.

SELECTED PREVALENCE RATES

DISABLING CONDITION	PREVALENCE RATE & SOURCE
Alcoholism	5.1% of Texas general population, Texas Commission on Alcoholism (TCA).
Autism	.04%, or approximately 5 out of every 10,000 live births, National Information Center for Handicapped Children & Youth (NIC for HC&Y).
Cerebral Palsy	700,000 Americans, or 16 out of every 5,000; 10,000 babies born each year and another 2,000 acquire it in early years of life, NIC for HC&Y.
Deafness and Hearing Impairments	16 million Americans have hearing impairments and of these, 2 million are deaf, Gallaudet College and the National Assoc. of the Deaf.
Down's Syndrome	1 per 800 live births, or approximately 7,000 in the U.S. each year, NIC for HC&Y.
Drug Abuse	5% of Texas population in need of counselling, Texas Department of Community Affairs (TDCA).
Emotional Disturbances	10% of the total school age population including 2% with severe emotional/behavioral problems, NIC for HC&Y.
Epilepsy	Approximately 2% of the national population, or 2 million Americans and 100,000 new cases each year, of which 3/4 are children or adolescents, NIC for HC&Y.
Learning Disabilities	2 to 3% of school-aged children and youth, NIC for HC&Y.
Mental Retardation	3% of general population, NIC for HC&Y.
Physical Disabilities and Special Health Problems	.5% of school-aged children, NIC for HC&Y.
Speech and Language Impairments	5% of school-aged children, NIC for HC&Y.
Spina Bifida (Cleft Spine)	40% of all Americans have bone openings in the spine; 4% have meningocele, with spine intact but sheath or covering in a sac, and of these 4%, 96% have a severed spinal column including bone and nerves, NIC for HC&Y.

Visual Impairments

7 per 1000 for those under 45, 44.5 per 1000 for those over 65, NIC for HC&Y.

INTRODUCTION

The Health Professions Annex provides data support for Chapter 8, Subchapter III, of the 1985 Preliminary State Health Plan.

POLICY ANALYSIS

Interested Statewide Organizations and Interested Local Organizations An extensive policy analysis review was conducted to identify major issues and concerns effecting health manpower professions in Texas. The following list represents the agencies and associations that contributed to the health professions policy analysis review.

Board of Nurse Examiners
Board of Vocational Nurse Examiners
Coordinating Board, Texas College & University System
Houston-Galveston Area Council
State Rural Medical Education Board
Texas Dental Association
Texas Department of Health
Associate Commissioner for Personal Health Services
Associate Commissioner for Professional Services
Associate Commissioner for Special Health Services
Bureau of Community Health Services
Bureau of Licensing & Certification

Texas Health Facilities Commission

Texas Hospital Association Texas Medical Association

Texas Nurses Association

Texas Pharmaceutical Association

Texas State Board of Medical Examiners

Texas State Board of Pharmacy

University of Texas Health Science Center, School of Public Health, Houston

The predominant issues and concerns identified through the policy analysis review could be capsulated as follows: uncertainties regarding the adequacy of future levels of physicians, nurses and dentists, given the preponderance of the distribution problem in Texas. Population-to-practitioner ratios vary considerably when compared at a county, council of government or health service area level. (Statistical reports are available for licensed practitioners in Texas for these aggregates.)

HEALTH MANPOWER SHORTAGE AREAS

Evidence of the problem of maldistribution in Texas is provided by Exhibit 3, Primary Care Health Manpower Shortage Areas (HMSAs) in Texas; and Exhibit 5, Dental Care Health Manpower Shortage Areas in Texas. The shortage areas in Texas can be further identified in Tables 1 and 3.

The health manpower shortage area program is a federal program aimed at alleviating the geographic maldistribution of health professionals. Section 332 of the Public Health Service Act as amended by the Health Professions Educational Assistance Act of 1976 (P.L. 94-484), provides general guidelines for identifying areas as Health Manpower Shortage Areas. In response to this mandate the Department of Health and Human Services (DHHS) (formerly DHEW) developed criteria for identifying health manpower shortage areas and published Interim-Final Regulations in the Federal Register on January 10, 1978 (43 FR 1586). After an extensive review and comment period, the revised criteria were published by DHHS as Final Regulations in the Federal Register on November 17, 1980 (45 FR 75996).

A designated area becomes eligible (1) for placement of National Health Service Corps (NHSC) personnel, (2) as a service area for purposes of repayment of health professions student loans, (3) as an obligated service area under the NHSC Scholarship Program, and (4) to apply (and receive preference) for grant funds under various sections of the Public Health Service Act.

The listing provided in Table 1 presents the results of a reassessment of the eligibility status of primary care HMSA designations conducted in 1984 by the Bureau of State Health Planning and Resource Development of the Texas Department of Health, and the Health Resources and Services Administration, DHHS. This activity represented the first comprehensive review of primary care HMSA designations to be conducted in Texas since the program's inception. Three-fourths of the primary care designations were recommended for continued designation. Approximately 25% of the 254 counties in Texas are designated as primary care shortage areas, and 15% as dental shortage areas.

Exhibit 1

INDEX TO COUNTIES

COUNTIES LOCATED WITHIN EACH HSA ARE INDICATED BY COUNTY CODE NUMBER AT THE BEGINNING OF EACH DATA SET. THE FOLLOWING LIST GIVES THE CODE FOR EACH COUNTY. THE NUMBER IN PARENTHESIS AFTER THE COUNTY NAME INDICATES THE HEALTH SERVICE AREA IN WHICH THE COUNTY IS LOCATED.

Table 1 - Page 4

TEXAS DEPARTMENT OF HEALTH PRIMARY CARE HEALTH MANPOWER SHORTAGE AREAS IN TEXAS

DATA SOURCES

- Column 1 COUNTY NUMBER Three digit county code.
- Column 2 SERVICE AREA NUMBER To differentiate from whole county designations, service area numbers are assigned to multiple county and subcounty designations. There are currently 40 service area designations, including the following: 3 multiple county designations (usually consisting of 2 whole counties designated as one service area), 20 subcounty geographic area designations, 15 facility designations, and 2 population group designations. The service area numbers range from 1 to 47. Listings are not included for service area numbers 4, 7, 9, 11, 12, 13 and 29 due to the recent de-designation or proposed de-designation of these areas.
- Column 3 COUNTY NAME/SERVICE AREA NAME County name for all designations and the service area name for multiple county and subcounty area designations.
- Column 4 1983 POPULATION TO PRIMARY CARE PHYSICIAN RATIO The Texas Department of Health Population Data System 1983 projections were utilized. The 1983 projected population figures were adjusted utilizing the age-sex expected visit rates included in the Criteria for Designation of Health Manpower Shortage Areas, November 17, 1980. If the adjusted population figure exceeded the projected population, the ratio was calculated utilizing the adjusted population in lieu of the projected.

For select counties, adjustments were made for the migrant farmworker population, tourists and seasonal residents.

The Texas Board of Medical Examiners' licensure file of August, 1983, was used to determine physician counts. Only primary care physicians engaged in direct patient care were selected from the file. Utilizing the number of practice hours provided on the physician's license, the number of full-time-equivalents was calculated.

Physician counts were adjusted in order to delete National Health Service Corps (NHSC) assignees; physicians employed in institutional settings such as Veteran's Administration hospitals, state hospitals, state schools, prison facilities; military installations; and in some cases student health centers of colleges and universities.

Column 5 - HIGH NEED INDICATORS? - An affirmative code indicates that the area meets one of the following conditions which were determined to be indicative of unusually high needs for primary medical care services.

- Column 5 1. Infant mortality rate greater than 20 (Five year average (continued) 1978-1982) (Source: Bureau of Vital Statistics, Texas Department of Health).
 - 2. 1982 fertility rate greater than 100 (births per 1,000 women aged 15-44) (Source: Bureau of Vital Statistics, Texas Department of Health).
 - 3. More than 20% of the population with incomes below the poverty level (Source: 1980 Census).
- Column 6 DEGREE OF SHORTAGE Designated areas are assigned to one of four degree-of-shortage groups based on the population to physician ratio and the presence or absence of unusually high needs. Group one represents areas with highest ratios, group 4, the lowest.
- Column 7 HEALTH MANPOWER SHORTAGE AREA DESIGNATION TYPE "Health manpower shortage area" (HMSA) means any of the following which the Department of Health and Human Services has determined to have a shortage of primary care manpower:
 - 1. a geographic area (whole county or part of a county),
 - 2. a population group, or
 - 3. a public or nonprofit private medical facility.
- Column 8 DESIGNATION THRESHOLD The number of primary care full-time-equivalents that could be added to the existing physician supply in order to meet the minimum HMSA designation ratio. (EXAMPLE: for geographic areas the minimum HMSA designation ratio is 3,000:1 for areas with high needs and 3,500:1 if high needs are not indicated.) The threshold is used to determine an area's qualifications for NHSC personnel.
- Column 9 NATIONAL HEALTH SERVICE CORPS (NHSC) ASSIGNEES The number of primary care NHSC physicians assigned to each HMSA.

TEXAS DEPARTMENT OF HEALTH DENTAL CARE HEALTH MANPOWER SHORTAGE AREAS IN TEXAS

DATA SOURCES

- Column 1 COUNTY NUMBER Three digit county code.
- Column 2 SERVICE AREA NUMBER To differentiate from whole county designations, service area numbers are assigned to multiple county and subcounty designations. There are currently 16 service area designations, including the following: 1 multiple county designation (consisting of 2 whole counties designated as one service area), 13 subcounty geographic area designations, and 2 population group designations. The service area numbers range from 1 to 23. Listings are not included for service area numbers 8, 10, 11, 14-17 due to the removal of these areas from the designation list.
- Column 3 COUNTY NAME/SERVICE AREA NAME County name for all designations and the service area name for multiple county and subcounty area designations.
- Column 4 DEGREE OF SHORTAGE Designated areas are assigned to one of four degree-of-shortage groups based on the population to dentist ratio and the presence or absence of unusually high needs for dental care services. Group one represents areas with highest ratios, group 4, the lowest.
- Column 5 HEALTH MANPOWER SHORTAGE AREA DESIGNATION TYPE "Health manpower shortage area" (HMSA) means any of the following which the Department of Health and Human Services has determined to have a shortage of primary care manpower:
 - 1. a geographic area (whole county-WCO or part of a county-PT),
 - 2. a population group (P GRP), or
 - 3. a public or nonprofit private medical facility (FAC).
- Column 6 NATIONAL HEALTH SERVICE CORPS (NHSC) ASSIGNEES The number of NHSC dentists assigned to each HMSA.

ANNEX - SUBCHAPTER IV: DRUG ABUSE

This annex contains background information, references and current data describing the drug abuse problem in Texas. The Texas Legislature has placed the primary responsibility for this concern with the Texas Department of Community Affairs and that agency is the primary source of information and contact point for inquiries on this topic.

ANNEX - SUBCHAPTER V: ALCOHOL ABUSE

This annex contains background information references and current data describing the alcohol abuse situation in Texas. The Texas Legislature has placed the primary responsibility for this concern with the Texas Commission on Alcoholism and that agency is the ultimate source of information and contact point for inquiries on this topic.

Background Information References

- 1. <u>County-Specific Prevalence Estimates of Adult Problem Drinking In Texas</u> (August, 1983), Miller, McWillilam, Tuckfeld and McCreuth, Center for Organizational Research and Evaluation Studies, T.C.U.; Source: Texas Commission on Alcoholism.
- 2. <u>Secretarial Initiative on Teenage Alcohol Abuse/Youth Treatment Conference</u> (October, 1983), National Institute on Alcohol Abuse and Alcoholism, DHHS.

Excerpts From The TCA/TCU Prevalence Study

In its effort to fulfill its state and federal legislative mandates, the Texas Commission on Alcoholism (TCA) responds to a broad range of human service needs through a continuum of concerns including prevention, intervention, treatment and rehabilitation. Since it is unlikely that the State of Texas will ever have enough resources to meet all the needs, one of TCA's functions, as state alcoholism authority, is designing and implementing service programs that will meet the most critical needs while gaining the greatest possible impact from available resources. Essential ingredients in this planning are reliable, valid, and sensitive data to be used in decision—making.

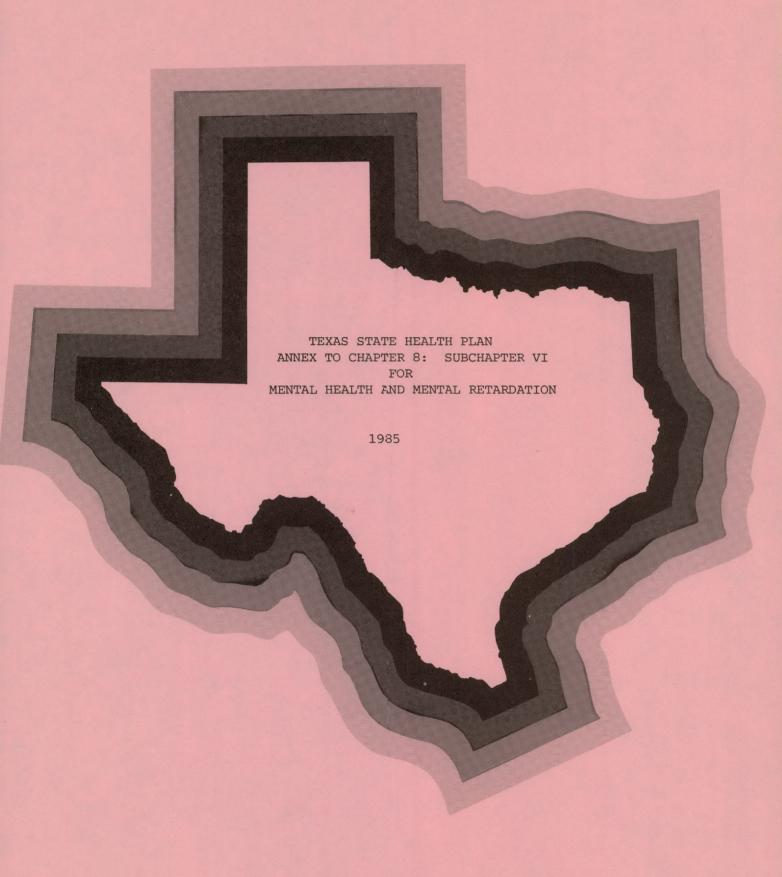

Until a few years ago, estimates of the prevalence of alcohol problems were limited principally to crude predictions based on cirrhosis mortality or based on small samples of national populations. Much of the data could not be used to determine reliably how many persons in specific areas are in need of what types of services. The broad methodologies and results have also not taken into account the variation in problems by age, sex, ethnic background, and geographic location.

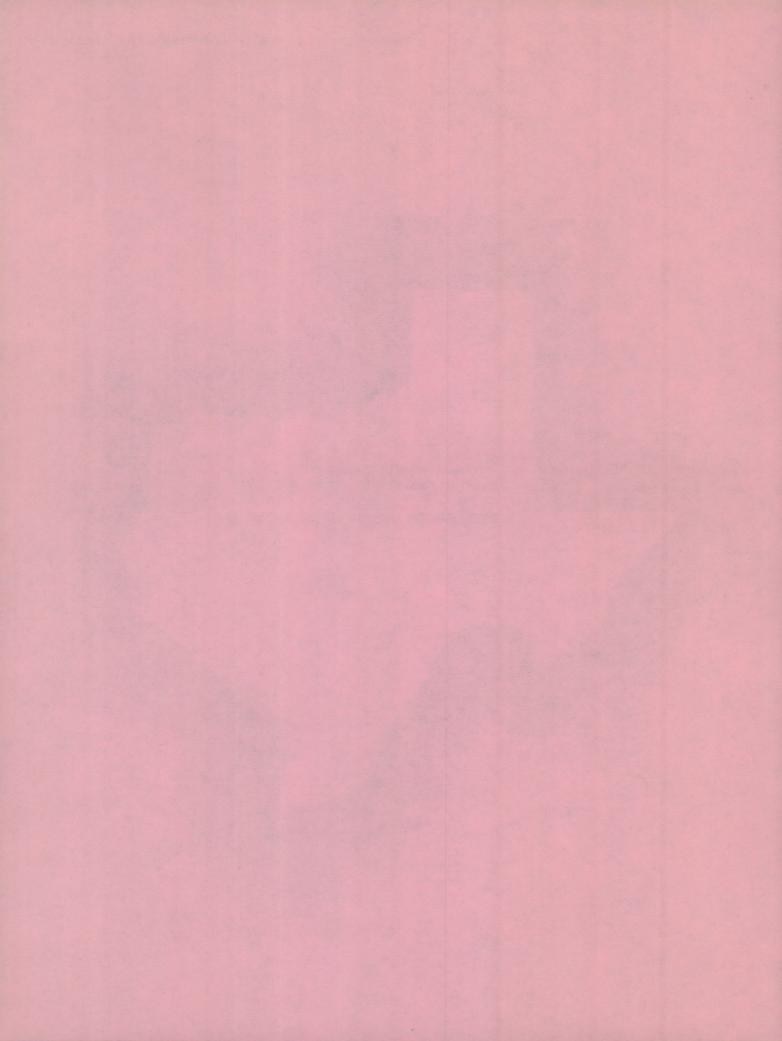

A variety of approaches have been used, including estimating the levels of problems associated with alcohol misuse, focusing on "reasons for drinking" surveys, the quantity-frequency indicators, the Jellinek formula, various alcohol consumption models, and demographic studies. However, two major obstacles have been experienced: (1) the data were too broad for planning at the community level and (2) the broad formulae resulting from many of the studies were inaccurate when applied to specific population groups.

In order to counter these obstacles and limitations, the Texas Commission on Alcoholism has contracted with the Center Organizational Research and Evaluation Studies of Texas Christian University to provide county-specific estimates of prevalence of alcohol abuse for the total population and for age, race, sex, and ethnic specific populations for each of the 254 counties in Texas.

TCA PROBLEM DRINKING PREVALENCE PROFILE

Annex-Subchapter VI: Mental Health & Mental Retardation

This appendix contains background information, references and current data describing the Mental Health and Mental Retardation situation in Texas. The Texas Legislature has placed the primary responsibility for this concern with the Texas Department of Mental Health and Mental Retardation and that agency is the ultimate source of information and contact point for inquiries on this topic.

Introduction

The information in this Annex is designed to support and elaborate the subject matter presented in Chapter 9 of the 1984 State Health Plan (SHP) for Texas.

Existing Federal laws and regulations governing the operation of the health planning program require the State Health Planning and Development Agency (SHPDA) to address the Resource Standards of the National Health Planning Guidelines (NHPG) and to make projections of bed need for certain types of medical facilities.

For convenience of presentation in the SHP and in this Annex, the NHPG and bed need projection materials have been grouped as indicated in the Table of Contents.

Background Information Regarding Bed Need Projection Ranges

P.L. 93-641 as amended includes a requirement to make bed need projections for certain specified types of medical facilities. In this year's SHP, projections are made for short term community hospitals (under 30 days average length of stay) and for nursing homes.

The projections of short term hospital bed need must be developed taking into account the resource standards of NHPG 1 & 2. Accordingly, the bed need projection ranges for 1989 and NHPG 1 & 2 are presented together in the first section of this Annex. The newly-developed bed projection methodology is also presented in this section.

In the long term institutional care area, the Statewide Health Coordinating Council (SHCC) decided to continue work on refining a bed need projection methodology for nursing home beds. The last section of this Annex contains a description of the new methodology and also nursing home bed need projection ranges for 1989.

Background Information Regarding the NHPG and Resource Standards

The 93rd Congress set forth in Section 1501 of the National Health Planning and Resource Development Act of 1974, P.L. 93-641, that the Secretary of the Department of Health, Education and Welfare (DHEW) (now the Department of Health and Human Services (DHHS)) issue by regulation guidelines concerning national health planning policy. In addition, the legislation stated the guidelines were to include standards respecting the appropriate supply, distribution and organization of health resources.

DHEW indicated that the NHPG as developed are to serve a dual purpose, i.e., (1) to be used by the Federal government to clarify and rationalize health policy and (2) to assist local and state planning agencies in carrying out their responsibilities in the development of area and state health plans. Per DHHS, the overall aim of the NHPG is to achieve equal access to quality care at a reasonable cost. The NHPG and standards issued on March 28, 1978 focus on two primary areas: (1) cost containment, i.e., costs must be restrained in order to

preserve resources needed for improved prevention, better access to services, and higher quality of care and (2) quality enhancement, i.e., quality can be enhanced by insuring sufficient volume to maintain highly skilled and experienced personnel. The regulations emphasize the need for a balance between the needs of state and local agencies to take into account unique local health conditions and the need for the Federal government to provide leadership and guidance.

Initially the regulations required that plans developed after 1978 must address the NHPG and be "consistent with" the resource standards. "Consistent with" was stated to mean that target levels expressed in plans could not be higher than the maximum levels nor lower than minimum levels unless a specific adjustment were justified on the basis of a thorough analysis. The regulations specify various types of adjustments which can be made. The adjustments allowable are primarily designed to be applied at the local level by individual health systems agencies. In fact, the Federal legislation and guidance specified that the health systems agencies are primarily responsible for addressing the Guidelines and for making adjustments to the standards where appropriate. Since the SHP was intended to be developed in large part from the individual health systems plans (HSPs), the SHP was also required to reflect the Guidelines. With the recent phase-out of the health systems agencies in Texas, the SHPDA is required to continue to address the Guidelines and consider appropriate adjustments.

P.L. 96-79 modified the "consistent with" requirement to "must take into account" the NHPG and resource standards. Essentially this means that the SHP must consider the NHPG and resource standards and justify any deviations therefrom with an appropriate rationale. As stated in the 1982 Texas SHP, it is believed the NHPG and Resource Standards are of most use when recognized and applied as their name implies, general guidelines and not arbitrary commondenominator type standards applicable to one and all circumstances alike. They should be used primarily as guides to our planning efforts in each of the respective subject areas covered by the NHPG.

Full citation of the individual NHPG and Resource Standards with supporting documentation are presented in the sections to follow.

GENERAL HOSPITAL BED SUPPLY RATIO AND OCCUPANCY RATES (NHPG 1 & 2) AND SHORT TERM INSTITUTIONAL CARE BED NEED PROJECTIONS

INTRODUCTION

Short term institutional care is inpatient care provided by community general and special hospitals available to the general public with an average length of stay under 30 days. In 1982 in Texas there were 523 such hospitals with 68,500 beds. Collectively they provided 16.3 million patient days of care with an average daily census of 44,580. To put these figures in perspective, 62% (325) of these facilities were 100 or less beds in size, yet their workload comprised only 24% of total patient days. By contrast, only 18 hospitals with 500 or more beds (3%) provided 20% of total patient days. To add yet another dimension, 66% (213) of these 325 smaller hospitals were in rural areas.

The Texas Department of Health as the SHPDA has been charged with responsibility for developing a methodology for determining the number of short term care hospital beds that will be needed in Texas in future years. The SHPDA formed an advisory group, the Technical Advisory Group on Bed Need Methodology, to assist in the development of this methodology. The Technical Advisory Group was composed of ten persons from various sections of the state who were familiar with the problems posed by bed need projection. Three SHPDA members staffed the group. (See Exhibit 1 for a list of Advisory Group Members.)

The basic bed need methodology developed by the SHPDA with the advice of the Technical Advisory Group and adopted by the SHCC is the use rate methodology. In its simplest form, the application of this methodology involves four steps. First current use rates are determined, i.e., the number of patient days generated for every 1,000 persons in the population is determined. This use rate is then applied to population estimates for the projection year to determine the number of patient days that would be generated in that year if the current use rate remained constant. These projected patient days are then divided by 365 to provide a projected average daily census. Finally, the average daily census is divided by the desired occupancy rate to give an estimate of the number of beds that will be needed. This four step process is summarized in Exhibit 2.

Although the SHPDA utilized this use rate methodology, several innovative changes were made to the basic methodology. These changes are enumerated in detail below but briefly consist of: (1) determining use rates for counties based upon patient days generated by residents of that county, (2) generating separate use rates for 24 age-sex-ethnic population subgroups, and (3) developing a range of occupancy rates based on existing rates.

METHODOLOGY

Description of Data Bases Patient Origin Destination (POD) studies were conducted by the TDH, Bureau of State Health Planning and Resource Development, in 1979-1980 and again in 1981-1982, in conjunction with the Texas Hospital Association. Data were collected on a quarterly basis during

each 12 month period with all hospitals asked to submit data on all patients during a specified week in each quarter. Approximately 98.5% of all hospitals surveyed in the studies submitted data for at least one quarter. Information collected on patients covered county of residence, sex, ethnicity, age, and type of service (e.g., obstetrics, pediatrics, etc.). Although all hospitals were given the same criteria for classifying patients into service types, there is a possibility that these criteria were not used consistently by all hospitals. However, since projections are not provided by service or for individual hospitals, this should not be a serious problem. Data from both POD studies, excluding the first quarter of 1979, were added together and this combined data set was used in the analysis described below.

The TDH also requests that all hospital facilities complete the Hospital Data Questionnaire each year. Among the data collected in this questionnaire is information concerning the number of patient days accumulated over the year for each of several services for the reporting facility. These data are also used in the analyses presented below.

The population figures used in projecting beds for 1989 are from the TDH population projections. These population projections are based on the assumption that in-migration will continue through the 1980's at the same rate as the 1970's.

Computation of Use Rates The combined POD data set was used to determine, for each facility, what percentage of the facility's patient days to allocate back to each county based on patient residence. In other words, the POD data were used to develop a pattern for each facility that could be used to allocate patient days reported on the Hospital Data Questionnaire back to the patient's county of residence.

Because the POD studies collected information on each patient's age, sex and race, it was possible to allocate patient days back to counties of origin retaining this information. Four age groups were used: ages 0-14, ages 15-44, ages 45-64, and ages 65 and over. Ethnic groups were white (non-hispanic), black and hispanic. All 24 combinations of sex, age and race were used when allocating patient days back to counties.

Before developing patterns for allocation of patient days, however, it was necessary to adjust the admission patterns obtained from the POD studies to take into account the differing lengths of stay of the various age groups. Therefore, admission patterns were weighted based upon the average length of stay (ALOS) reported for the Southern United States** for the four age group

^{*}The first quarter of the 1979-1980 Study involved a different data collection plan from the other three quarters and from the 1981-82 Study, and was excluded for this reason.

^{**}National Center for Health Statistics. B. J. Haupt: Utilization of Short-Stay Hospitals: Annual Summary. Vital and Health Statistics. Series 13, No. 64 DHHS Pub. No. (PHS) 82-1725. Public Health Service. Washington. Government Printing Office, March 1982. (Texas data needed for calculation of ALOS by age group and sex combinations are not available.)

and sex combinations (data were not available by race) for all services. (Some error was introduced by using length of stay averaged across all four services but length of stay for each service by age and sex was not available.) Weighting was achieved by multiplying the number of admissions by the ratio of the average length of stay for that age and sex category to the average length of stay for the same sex 0-14 age category. Average lengths of stay and weighting ratios for the various categories are shown in Table 1. Ages 65 and over received the greatest weight as patients in this age category are likely to have the longest hospital stays and ages 0-14 received the smallest weight as these patients are likely to have the shortest hospital stays. At all ages except 15-44, females were weighted more heavily than males as they tended to have longer average lengths of stay.

An example is provided below to help explain this allocation process. Assume facility #1 had 100 admissions reported in the POD study. Further that two of these admissions were white males ages 65 and over from Anderson County. These two admissions were then weighted by the ALOS for males ages 65 The weighting ratio is 2.4 (obtained from Table 1) so two and over. admissions X 2.4 ALOS = 4.8 weighted admissions for white males ages 65 and over in Anderson County. Assume 10 admissions were black females ages 15-44 from Brazos County. The weighting factor for females ages 15-44 is 1.07 (again, from Table 1); 10 admissions X 1.07 ALOS is equal to 11 weighted admissions for black females ages 15-44 in Brazos County. This same process was repeated for all facility #1 admissions. These weighted admissions were then added together to give a total number of weighted admissions for that facility and the number of weighted admissions in each age-sex-ethnic category for each county were divided by the total number of admissions to get percentages. In the example, assume the total number of weighted admissions was 187. Then 2.6% were from white males 65 and over in Anderson County (4.8 weighted admissions ÷ 187 total weighted admissions) and 5.9% were from black females ages 15-44 in Brazos County (11 + 187).

For each facility, there were a possible 6,096 percentages (254 counties by two sexes by three ethnicities by four age groups). The actual number of patient days reported on the 1982 Hospital Data Questionnaire by the facility was then multiplied by each of the percentages to give an estimate of 1982 patient days by age-race-sex subpopulation and county of residence. In the example above, if 2,000 patient days were reported by facility #1, then 2.6%, or 52 patient days, were attributed to white males age 65 and over in Anderson County. An additional 5.9%, or 118 patient days, were attributed to black females ages 15-44 in Brazos County.

The process described above was repeated for each facility and the patient days estimated for each age-sex-ethnic subpopulation for each county were added together to give an estimate of the total patient days for each subpopulation generated by residents of each county.

Patient days were also reported separately on the Hospital Data Questionnaire for type of service: medical-surgical, pediatric, obstetrics and psychiatric. Type of service was also available for each admission in the POD study. Therefore, separate weighted patterns of admissions were derived for each of these four services and each pattern was applied to patient days reported for that service on the Hospital Data Questionnaire.

In sum, patient days reported for each of four services by a facility on the Hospital Data Questionnaire were allocated back to counties of origin for various age, sex and ethnic groups based upon weighted admission patterns for each service obtained from the POD studies. This methodology provided an estimate, for each county, of the patient days generated by residents of that county for the four types of services.

These patient day estimates for each county were then used, along with county population figures, to obtain use rates. More specifically, patient days generated by a particular age-sex-ethnic group for a particular county were divided by the county population in that age-sex-ethnic group to give a use rate. For example, if 2,000 patient days were generated in Brazos County by black females ages 15-44 and the population of black females ages 15-44 in Brazos County was 5,000, the use rate would be .4 (2,000 divided by 5,000) or 400 patient days generated for every 1,000 black females ages 15-44.

Use rates were computed for each of the four services (medical-surgical, pediatrics, obstetrics and psychiatric) for each of the 24 age-sex-ethnic combinations. These use rates were computed for three years: 1980, 1981 and 1982. A comparison of use rates across the three years revealed considerable consistency. Therefore, it was decided to use 1982 rates for projecting patient days for 1989.

Projection of Patient Days Use rates generated in 1982 for each county and service for the 24 age, sex and ethnic categories were applied to 1989 population projections to obtain estimates of patient days generated in 1989. If any of the 1982 use rates for a county were based on a population less than 100, the average use rate for the state in that particular age-sex-ethnic category for that service was substituted. These substitutions were made because populations of less than 100 were judged unlikely to produce stable use rates and the average rate for the State of Texas for that category appeared to be the most appropriate substitute.

Patient day projections for each service and age-sex-ethnic category were added together to give a single estimate for each county of projected patient days for 1989. However, these patient day projections were based solely upon patient days generated by county residents; patient days generated in Texas by out-of-state residents were not included in these projections. In other words, when patient days generated in a facility were allocated back to the patient's county of residence and use rates were developed for these counties, patient days generated by out-of-state residents were lost. Obviously, patient day projections must be adjusted to include patient days generated by non-Texas residents.

Based on the POD study, in both 1981 and 1982, 2.4% of patient days generated in Texas were generated by out-of-state residents. Therefore, a projection was obtained for patient days generated by out-of-state residents in 1989 by assuming that the patient days projected for 1989 using the use rate methodology described above were 97.6% of the total patient days and that the remaining 2.4% were due to non-Texas residents. Using the POD study, a

pattern was developed showing the percent of total out-of-state admissions that occurred in each county. The patient days projected for non-Texas residents in 1989 were then distributed to counties according to this pattern. Therefore, those counties that had more out-of-state patients in the POD study (such as the border counties), had more out-of-state patient days allocated to them in 1989 than other counties.

A second adjustment to the 1989 projections was necessary because the use rate projections previously described did not include patient days generated in short term care hospitals in the following services: Drug Abuse, Alcohol, Tuberculosis, Rehabilitation, Long Term Care and Self Care. These patient days were excluded because the POD study did not classify these services in the same way as the Hospital Data Questionnaire. Therefore, it was not possible to develop a pattern from the POD study that could be used to distribute patient days obtained from the Hospital Data Questionnaire back to counties of residence. However, the number of patient days attributed to these services is quite small -- 1.6% in 1981 and 1.9% in 1982 (according to data obtained from the Hospital Data Questionnaire). Consequently, it was decided to simply assume for each county that the number of patient days in these services in 1989 would be 2% of the total patient days and adjust the patient day projections accordingly. This is not an ideal solution but given the current data bases, it is probably the best adjustment that can be made at this time.

Finally, patient day projections for counties were aggregated to the state planning region (SPR), health service area (HSA) and state levels.

Projection of Beds To convert 1989 patient day projections for the 24 SPRs to needed beds, appropriate occupancy rates had to be selected for the SPRs. As noted previously, occupancy rates differ for facilities of different sizes, i.e., larger facilities tend to have higher occupancy rates than smaller facilities. Therefore, simply averaging current occupancy rates for facilities within a SPR was inappropriate; rather, a method had to be selected that took into account differences in facility size. Accordingly, occupancy rates were weighted by the number of beds in a facility. Weighting consisted of multiplying each facility's occupancy rates by the number of beds, summing these products and then dividing the sum by the total number of beds in the area. An example is provided in Exhibit 3.

The method outlined above was used to obtain occupancy rates for SPRs. These occupancy rates are, of course, merely a reflection of current (1982) occupancy rates. Beds derived from these occupancy rates represent the maximum number of beds that should be needed in 1989 (barring unforeseen circumstances). However, current occupancy rates are generally lower than the ideal occupancy of 80% set by the NHPG. Therefore, a second set of bed projections was made in which a minimum acceptable occupancy rate based on facility size was utilized. These minimum occupancy rates were based on the average 1982 occupancy rates of Texas hospitals by bed size, as shown in Table 2. Occupancy rates for facilities of approximately the same size are about

the same in both metropolitan and non-metropolitan areas. Apparently, the crucial factor in occupancy rates is size of facility rather than location of facility. Therefore, these average 1982 occupancy rates for the five facility bed size groups (regardless of metro or non-metro location) were used to set minimum acceptable occupancy rates to be targeted by facilities for 1989; these target rates are shown in the last column in Table 2.

In obtaining this second set of average weighted occupancy rates for SPRs, if a facility had an occupancy rate below the minimum target occupancy for that sized facility, the minimum targeted occupancy was substituted for the actual occupancy. However, if the facility occupancy rate was equal to or greater than the minimum targeted occupancy, the actual facility occupancy was used in computing a weighted average for the SPR. For example, if facility #1 had 45 beds and a 40% occupancy rate, a 50% occupancy rate target was substituted for the 40% when computing an average occupancy for the SPR. The substitution was made because a 40% occupancy was considered unacceptably low, even for a small hospital of 45 beds. This second method resulted in 1989 bed projections for each SPR that represent a reasonable and realistic goal toward which the SPR should strive.

NATIONAL HEALTH PLANNING GUIDELINES

Existing federal laws and regulations require that the National Health Planning Guidelines (NHPG) be taken into account in the development of the State Health Plan. NHPG #1 and #2 address the supply of non-federal general hospital beds and therefore, must be considered in developing estimates of future bed needs. These federal guidelines are reproduced below.

Guideline #1, General Hospitals - Bed Supply

Standard (Based on licensed beds as required by the NHPG)

"There should be less than four non-federal, short-stay hospital beds for each 1,000 persons in a health service area except under extraordinary circumstances. For purposes of this section, short-stay hospital beds include all non-federal, short-stay hospital beds (including general medical-surgical, children's, obstetric, psychiatric, and other short-stay specialized beds). Conditions which may justify adjustment in this ratio for a health service area include:

"(1) Age: Individuals 65 years of age and older have a higher hospital utilization rate - up to four times that of the general population than any other age group. Bed population ratios for health service areas in which the percentage of elderly people is significantly higher (more than 12% of the population) than the national average may be planned at a higher ratio, based on analysis by the health systems agency.

- "(2) Seasonal population fluctuations: Large seasonal variations in hospital utilization may justify higher ratios. Plans should reflect vacation and recreation patterns as well as the needs of migrant workers and other factors causing unusual seasonal variations.
- "(3) Rural areas: Hospital care should be accessible within a reasonable period of time. For example, in rural areas in which a majority of the residents would otherwise be more than 30 minutes travel time from a hospital, the health systems agency may determine, based on an analysis, that a bed population ratio of greater than 4.0 per 1,000 persons may be justified.
- "(4) <u>Urban areas:</u> Large number of beds in one part of Standard Metropolitan Statistical Area (SMSA) may be compensated for by fewer beds in other parts of the SMSA.
- "(5) Areas with referral hospitals: In the case of referral institutions, which provide a substantial portion of specialty services to individuals not residing in the area, the health systems agency may exclude from its computations of bed population ratio the beds utilized by referred patients who reside outside both the SMSA and the health service area in which the facility is located."

Guideline #2, General Hospitals - Occupancy Rate

Standard

"There should be an average annual rate for medically necessary hospital care of at least 80% for all non-federal, short-stay hospital beds considered together in a health service area, except under extraordinary circumstances. Conditions which may justify an adjustment to this standard for a health service area include:

- "(1) Seasonal population fluctuations: In some areas, the influx of people for vacation or other purposes may require a greater supply of hospital beds than would otherwise be needed. Large seasonal variations in hospital utilization which can be predicted through hospital and health insurance records may justify an average annual occupancy rate lower than 80% based on analyses by the health systems agency.
- "(2) Rural areas: Lower average occupancy rates are usually required by small hospitals to maintain empty beds to accommodate normal fluctuations of admissions. In rural areas with significant numbers of small (fewer than 4,000 admissions per year) hospitals, an average occupancy rate of less than 80% may be justified, based on the analysis by the health systems agency."

Application of Guidelines to Bed Need Methodology NHPG #1 states that there should be a maximum of four beds for every 1,000 persons. However, adjustments to this ratio are allowed for certain situations. Many of these adjustments are automatically taken into account with the use rate methodology reviewed in the previous section.

Under NHPG #1, more beds are allowed for populations with a higher percentage of elderly persons. The use rate methodology as applied here allows use rates to be considerably higher for persons aged 65 and above. These higher use rates are then applied to population estimates for age 65 and above so that if, in the target year, there is a higher proportion of elderly persons, more beds per 1,000 residents will be projected.

More beds are also allowed under NHPG #1 for seasonal population fluctuations. Seasonal population fluctuations refer to situations in which there are extended periods during the year when the daily census is considerably higher than the rest of the year. An example would be a hospital in a resort area that has a low daily census September through May but a high census throughout the summer. The use rate methodology projects beds based on an average daily census computed over the entire year. Therefore, seasonal population fluctuations are not considered in the development of use rates. However, seasonal population fluctuations are taken into account with the occupancy rates discussed under NHPG #2.

NHPG #1 also allows for more beds/1,000 for rural areas and, in certain situations, for urban areas. Rural and urban areas are considered in the use rate methodology presented here because the methodology is applied separately to each county based upon residents of the county. Therefore, some counties may generate a use rate resulting in more beds per 1,000 than other counties. This bed to population ratio is based upon actual utilization rates by county residents.

NHPG #2 states that there should be an annual occupancy rate of at least 80% except under extraordinary circumstances. Extraordinary circumstances are defined as seasonal population fluctuations and rural areas (because of the smaller sized hospitals in these areas). As indicated previously, the size of facilities was considered when determining occupancy rates for the various areas, with lower occupancy rates allowed for smaller hospitals. Furthermore, occupancy rates used in projecting beds were based on current occupancy rates and if significant seasonal population fluctuations occurred, they should be reflected in these current rates.

There are several other reasons to expect lower occupancy rates in Texas. NHPG occupancy standards are determined by using licensed beds. Therefore, the occupancy rates used in determining the bed projections are based on 1982 occupancy rates for licensed beds. In Texas, however, licensed beds are not always equal to operating beds; some facilities may have more licensed beds than operating beds. Therefore, if occupancy rates are calculated based on licensed beds, occupancy rates may appear lower than they actually are. Another reason for lower occupancy rates is that many urban areas in Texas are undergoing a rapid increase in population due to the much publicized "sun belt" migration. The population increases have resulted in new hospitals in

these rapidly growing areas and yet it may take several years for these new hospitals to gain community acceptance, i.e., their occupancy rates should gradually increase as more physicians and individuals become familiar with, and begin to utilize the new facilities.

Finally, the advantage of providing a range in occupancy rates, as stated earlier, is to allow local circumstances that may occur to be taken into account. As noted earlier, there may be particular local circumstances not taken into account by the methodology that dictate more (or fewer) beds than expected on the basis of past utilization. These anomalies can be taken into account by using the upper (or lower) range of projected beds.

In summary, it appears that the use rate methodology as presented here automatically allows for considerable adjustments to beds/1,000 ratios and occupancy levels based on a wide variety of local circumstances.

RESULTS

Table 3 shows the number of licensed beds in existence in 1982 and Table 4 shows the number of licensed beds as of February 29, 1984. There was only a slight increase in beds, 68,500 beds to 69,882 beds from 1982 to 1984, and a decrease in the beds per 1,000 population ratio from 4.6 to 4.4. Table 5 shows the number of licensed beds projected for 1989 for the 24 SPRs. projections are also added together to provide projections for health service areas and for the state. Using weighted 1982 occupancy rates, 81,368 beds are projected for Texas for 1989, 5,558 more beds than are licensed, CON approved or under construction as of February 29, 1984 (See Table 6). As indicated previously, this represents the upper range or maximum number of beds that should be needed in 1989 barring unforeseen circumstances. Setting a minimum occupancy rate for all facilities based on facility size, 75,431 beds are projected for 1989, 379 fewer beds than are licensed, CON approved or under construction in 1984. This second set of lower range projections provides a goal toward which the state and each SPR should strive.

Table 7 provided a listing of short term facilities as of February 29, 1984.

DISCUSSION

The bed range projections resulting from this proposed methodology provide estimates of the number of beds that will be needed in 1989 in SPRs by residents of those areas, i.e., the bed projections are population based. This is a somewhat different approach to bed projection than has been used in previous SHPs. In the past, bed need projections were based strictly upon existing facilities. Such projections tended to promote the status quo. For example, counties or Service Trade Areas (STAs) that were under-bedded would tend to remain under-bedded because projections were based on current utilization — utilization that was low because beds were not available and residents were forced to go to other counties or STAs.

The projection methodology presented in this proposal allows for estimates to be made of the bed need of an area regardless of where residents are currently being treated. With this type of information, planning for new facilities and for the expansion of existing facilities can proceed on a much more equitable basis.

It should be noted that these bed need projections are based upon demand for services and not upon actual need for services. In other words, areas in which residents are not utilizing services as much as they should (perhaps because of long distances to facilities) will have beds projected for their area based upon how much they utilize hospitals, not upon how much they should utilize hospitals.

The decision on where to place beds that have been projected for an area is a difficult one and should not be based entirely on bed need generated by area A variety of factors need to be considered in making such decisions and no single methodology is capable of considering all factors. Obviously, the resident population's demand for beds is of great importance but other factors must also be considered such as the nature and location of existing facilities and the nature of the area itself. In some situations it may be more appropriate to place beds utilized by residents of one area in another area. For example, a large rural area with a scattered population may generate a demand for a certain number of beds and yet, may not be able to support a hospital. In this situation, it might be more appropriate to place the beds generated by this scattered rural population in adjacent urban centers. There are also areas that contain a number of referral hospitals that draw patients from throughout the state. Patients go to these facilities because of the particular expertise that is offered by the facilities -expertise that cannot be duplicated in other smaller hospitals. these areas should be allowed more beds than are generated from the demand of area residents alone.

Finally bed need projections have not been provided at the county level. The methodology was not designed to provide county level or institution specific projections (which would result from county level projections in the 125 counties with only one hospital). If the methodology is used to provide county level projections, a number of problems are encountered. First, there is no method for determining appropriate occupancy rates for counties without facilities. Second, our projections are based solely on the demand of area residents. Other factors that affect bed need (as discussed above) are not considered. This is a much more serious problem when projections are made at the county level than at the SPR level. Finally, there are problems in applying the methodology at the county level because of limitations in available data. For example, average length of stay figures by service (and by age and sex) were not available and therefore, length of stay figures averaged across all services were utilized. These problems are not serious at the SPR or health service area level but could potentially be quite serious at the county level.

In summary, this proposed methodology provides area bed projections needed to support the development of an effective long range health care program. Actual placement of projected beds should be considered, however, in light of existing facilities and the nature of the areas themselves.

It should be recognized that mathematically derived estimates of bed need several years in the future are, in fact, best estimates of such future needs. Specific, documented circumstances reflecting a host of current factors at any particular time and place, e.g., unique local needs or substantial change in prevailing conditions, will often outweigh a long range projection estimate in a given contemporary situation.

SUMMARY OF USE RATE METHODOLOGY

Step 1:	Patient Days = Use Rate Population
Step 2:	Use Rate X Future Population = Projected Patient Days
Step 3:	Projected Patient Days = Projected Average Daily Census 365
Step 4:	Projected Average Daily Census = Beds Desired Occupancy Rate

TABLE 1

AVERAGE LENGTH OF STAY IN SHORT TERM CARE HOSPITALS
FOR THE SOUTHERN UNITED STATES, 1980

	 Ма	les	I	Females			
Age	ALOS*	Weighting Ratio**	ALOS	Weighting Ratio			
0-14	4.3	1.00	4.5	1.00			
15-44	6.3	1.47	4.8	1.07			
45-64	8.1	1.88	8.3	1.84			
65+	10.3	2.40	11.0	2.44			

^{*}ALOS = Average length of stay

Source: National Center for Health Statistics, B. J. Haupt:
Utilization of Short-Stay Hospitals: Annual Summary.
Vital and Health Statistics. Series 13, No. 64. DHHS
Pub. No. (PHS) 82-1725. Public Health Service.
Washington. Government Printing Office, March 1982.

^{**}Ratio = Ratio of average length of stay (ALOS) for each category to the ALOS for the 0-14 age category.

EXHIBIT 3

COMPUTATION OF WEIGHTED OCCUPANCY RATES

An example showing the difference between an average occupancy rate and an average occupancy rate weighted by bed size* is provided below:

Facility	Average Daily Census	Number of Beds	Occupancy Rate	Beds X Occupancy Rate
1	15	30	50%	1500
2	22	40	55%	2200
3	255	300	85%	25500
Total	292	380	190%	29200

Average occupancy =
$$\frac{\text{≤ Occupancy rates}}{\text{# Facilities}} = \frac{190}{3} = 63.3\%$$

Average weighted occupancy =
$$\frac{\angle \text{Beds X occupancy}}{\angle \text{Beds}} = \frac{29200}{380} = 76.8\%$$

If we then plug the weighted occupancy rate into the bed projection formula $\frac{ADC}{Occupancy}$ = beds we come up with the actual number of beds for the area: $\frac{292}{.768}$ = 380

However, if we use the simple average occupancy rate, we project more beds than actually exist:

 $\frac{292}{.633} = 463$

^{*}The average occupancy rate weighted by bed size for an area can be calculated by dividing the average daily census for the area by the total number of beds for that area. The weighting procedure above was shown to illustrate how individual facility occupancy rates could be replaced by a standard occupancy rate and a new set of bed needs calculated for an area.

^{*} RECORDS UPDATED THROUGH FEBRUARY 29, 1984

source: 1984 integrated facilities file, TDH. This listing includes all licensed short term care (under 30 days) community general and special hospitals, exclusing federal and state, which were open and which were available to the general public.

PERINATAL SERVICES

Guidelines 3 and 4 and their resource standards are quoted from CFR 42, Part 121 as follows:

Guidelines #3 - Obstetrical Services

Standards

- (1) "Obstetrical services should be planned on a regional basis with linkage among all obstetrical services and with neonatal services.
- (2) Hospitals providing care for complicated obstetrical problems (Levels II and III) should have at least 1,500 births annually.
- (3) There should be an average annual occupancy rate of at least 75% in each unit with more than 1,500 births per year."

Guideline #4 - Neonatal Special Care Units

Standards

- (1) "Neonatal services should be planned on a regional basis with linkages with obstetrical services.
- (2) The total number of neonatal intensive and intermediate care beds should not exceed 4 per 1,000 live births per year in a defined neonatal service area. An adjustment upward may be justified when the rate of high-risk pregnancies is unusually high, based on analyses by the health systems agency.
- (3) A single neonatal special care unit (Level II or III) should contain a minimum of 15 beds. An adjustment downward may be justified for a Level II unit when travel time to an alternate unit is a serious hardship due to geographic remoteness, based on analyses by the health systems agency."

Background The above quoted NHPG Resource Standards were discussed in summary form at the statewide level in Chapter 9 of the SHP. The tables to follow provide additional data at the health service area (HSA) and the state planning region (SPR) levels. The information in these tables will allow preliminary evaluation regarding the availability of perinatal inpatient services in specific areas throughout the State. These data should provide an initial focus to the task force recommended in the SHP in its review of regionalization to support the delivery of perinatal inpatient services. Additionally, the information should support more definitive local area analysis, especially as the local organizations/groups which are expected to become involved in the health planning process, in fact, come on line.

The first step in the development of a regionalized system of perinatal care services is to determine levels of care for hospital units which provide services to both mothers and newborns. Formal designation of individual hospital units in terms of levels of care will enhance the overall design for regionalization and help encourage the use of the most appropriate level of care through the proper referral of patients.

Most of the health systems agencies had initiated action to assign levels of care to hospitals providing obstetrical services; however, the method of determination varied among those agencies. Some used detailed questionnaires, some used on-site surveys, some used a combination of questionnaires and site surveys, and some used the annual TDH Hospital Questionnaire. With the phase-out of these agencies, this source of determination was lost. Accordingly, the determinations made by individual hospitals, as reflected in the TDH Hospital Questionnaires, provides the information for this plan. Hospital beds are licensed in Texas without consideration of specialized use. Beds designated by the hospitals as operating obstetrical beds are used to address the obstetrical guideline standards.

Discussion/Conclusions As indicated in the SHP, the size of an OB unit has an impact when comparing units with the NHPG standards. As also mentioned, no standard is specified for size of OB units, but one state (New Jersey) adopted 20 beds as the desired minimum for all OB units with exceptions allowed for Level I units down to 10 beds to accommodate geographic isolation or medical necessity. This number of beds would probably be too high for Texas with its many rural areas and small hospitals. Nonetheless it may be advisable to consider some minimum number of beds as guidance for Level II and Level III units to encourage the benefits of specialization without discouraging the development of units in smaller hospitals.

If, for example, a 10 bed level were applicable, then 34% of Level II units would meet the 1000 annual birth standard and 25% would meet the 75% occupancy standard. At a 20 bed level, these figures would be 64% and 47% for Level II units. Cumulatively for both Level II and Level III units, these figures would be 50% and 40% at a 10 bed level and 77% and 61% at a 20 bed level. While emphasis need not be on percent of accord with the NHPG standards, these figures tend to illustrate that unit size is a factor in making this evaluation, especially in Texas. It also indicates the need for accurate classification of unit levels.

In addition, as indicated in the SHP, a number of individuals, groups, organizations, and agencies were contacted to provide key issues regarding the availability, delivery and reimbursement of these services in Texas. The input received can generally be summarized as follows:

-Inadequate facilities for care of high risk obstetric and neonatal patients in some areas, including insufficient Level II unit beds which can lead to longer stays in Level III units.

-Lack of reliable transportation for high risk neonates to Level II and III units in some areas.

-For lower socio-economic groups, the continuing problem of obtaining adequate prenatal care, which can lead to an increased risk of perinatal problems.

-Reluctance by some Level II and III units to accept referrals of high risk infants whose families have limited or no ability to pay for service, and collaterally, recognition of political constraints regarding inability or unwillingness of some counties to accept responsibility for indigent care.

- -Need for improved coordination among organizations involved in addressing these concerns, but difficult to achieve in view of limited physical resources and problems in obtaining adequate patient care reimbursement.
- -If no improvement in funding, then perhaps a more equitable method of distributing charity patients.
- -Increased survival of low birth weight infants creates increased economic burden on Level III units.
- -Lack of a standardized method for reporting data from institutions as it relates to perinatal outcomes.
- -Need for centralized referral and tracking system managed by one agency in an area.
- -Need for improved coordination of activities among perinatal providers and with communities that provide little or no perinatal care.
- -High costs of services and problems with methods of paying for services.
- -Need for more detailed data base and improved methods for classification of service levels, especially to support development of regionalized perinatal service plans.
- -Need for statewide, state-based system for funding.
- -Lack of regionalized method of managing Level II and III care and need for such a system.

From the above, there appears to be an array of issues which can be related to a need for regionalization of perinatal services. In support of this, the literature is replete with examples of improved perinatal services both in terms of the quality of and access to services, as well as the management and cost aspects of service, when regionalization of services is implemented. In addition, the literature contains considerable documentation with detailed suggestions concerning regionalization of services. An example is the document entitled, "Texas Regional Perinatal Care System - Statewide Guidelines for the Care of Mothers/Fetuses and High-Risk Infants," developed by the Perinatal consultants to the Texas EMS Advisory Council and published by TDH.

Thus the overall aim of the SHCC and SHPDA should be to work toward and reasonably assure the availability and accessibility of appropriate perinatal services throughout the State while minimizing unnecessary duplication of services. It is readily recognized that a number of organizations have been working for several years toward this same goal. Most of the health systems agencies had initiated studies or actions of differing degrees of scope regarding regionalization of perinatal services as they addressed the Federal NHPG. With the recent phase-out of these agencies this activity has ceased, but it needs to be resumed. The time for action is now and this appears to be a timely period for action.

Recommendations The issues and problems are manifold, but generally are well-known and most often can be related to the need for regionalization of services. The basic problem involves the development of a mechanism to achieve and fund regionalization. The most realistic approach to effectively address these issues in a pragmatic manner appears to be via the creation of a task force of knowledgeable individuals representing organizations involved with the delivery of perinatal services. And since virtually all of the NHPG involve regionalization of specialized medical services, it is advisable to establish a Task Force on Regionalization of Specialized Medical Services. As a result, issues common to any area of specialized medical regionalization can be addressed without duplication of effort. At the same time individual specialized medical care areas with unique issues can be addressed by adding specialists in the areas of unique concern. Such a task force can establish priorities for regionalization of services and develop achievable goals in an acceptable timeframe.

The task force should address but not be limited to the following issues:

-Problem issues identified from the input received from the organizations contacted regarding the delivery of perinatal services.

-Problems identified in Chapter 9 relating to perinatal and other specialized services such as better methods to determine levels of care, size of units, and regional service areas by specialty.

-Issues common to all regionalization efforts such as funding/reimbursement; transportation; referral patterns, agreements and systems; medical recording methods among facilities; communication requirements; legal implications; and decision-making authority.

-Careful review and evaluation of the considerable volume of existing literature regarding regionalization of services.

The task force should be established by and under the auspices and direction of the Statewide Health Coordinating Council with staff support from the Bureau of State Health Planning and Resource Development, TDH. It should have membership representation from the SHCC, COGs, consumers, and state agencies/organizations/advocacy groups involved in the delivery, reimbursement and advocacy of specialized medical services in Texas. This membership should include but not be limited to consumers and individuals from TDH, TDHR, THFC, TMA, THA, and organizations/associations/groups representing specialized areas of medical services. Precise composition of the task force should be delineated by the SHCC. The task force should be established by the SHCC following approval of the SHP by the Governor.

PEDIATRIC INPATIENT SERVICES

Guidelines 5 and 6 and their resource standards are quoted from CFR 42, Part 121 as follows:

Guideline #5, Pediatric Inpatient Services - Number of Beds

Standard

"There should be a minimum of 20 beds in a pediatric unit in urbanized areas. An adjustment may be justified when travel time to an alternate unit exceeds 30 minutes for 10% or more of the population, based on analysis by the health systems agency."

Guideline #6, Pediatric Inpatient Services - Occupancy Rates

Standard

Pediatric units should maintain average annual occupancy rates related to the number of pediatric beds (exclusive of neonatal special care units) in the facility. For a facility with 20-39 pediatric beds, the average annual occupancy rate should be at least 65%; for a facility with 40-79 pediatric beds, the rate should be at least 70%; for facilities with 80 or more pediatric beds, the rates should be at least 75%."

The above quoted NHPG Resource Standards were discussed in summary form at the statewide level in Chapter 9 of the SHP. The tables to follow provide additional data at the health service area (HSA) and the state planning region (SPR) levels. The information in these tables will allow preliminary evaluation regarding the availability of pediatric inpatient services in specific areas throughout the State. These data should provide an initial focus to the task force recommended in the SHP in its review of regionalization to support the delivery of pediatric inpatient services. Additionally, the information should support more definitive local area analysis, especially as the local organizations/groups which are expected to become involved in the health planning process, in fact, come on line.

In addition to consideration of elements common to any regionalization initiative, the recommended task force should consider areas singular to pediatric inpatient services. The task force should consider the appropriate size and location of pediatric units taking the NHPG standards into consideration and local variances as may be necessary. The task force should address appropriate occupancy standards for regional areas taking into consideration local variances. This should include maintenance of an adequate supply of pediatric beds to accommodate peak utilization periods with adjustments to reasonably ensure access to care. The task force should be able to obtain local/regional informational assistance as an area planning capability evolves. This is essential to effective regional planning.

Composition and staff support requirements for the task force are as indicated in the perinatal annex section.

OPEN HEART SURGERY AND CARDIAC CATHETERIZATION

Guidelines 7 and 8 and their resource standards are quoted from CFR 42, Part 121 as follows:

Guideline #7, Open Heart Surgery

Standard

- "(1) There should be minimum of 200 open heart procedures performed annually, within three years after initiation, in any institution in which open heart surgery is performed for adults.
- "(2) There should be a minimum of 100 pediatric heart operations annually, within three years after initiation, in any institution in which pediatric open heart surgery is performed, of which at least 75 should be open heart surgery.
- "(3) There should be no additional open heart units initiated unless each existing unit in the health service area(s) is operating and is expected to continue to operate at a minimum of 350 open heart surgery cases per year in adult services or 130 pediatric open heart cases in pediatric services."

Guideline #8, Cardiac Catheterization

Standard

- "(1) There should be a minimum of 300 cardiac catheterizations, of which at least 200 should be intracardiac or coronary artery catheterizations, performed annually in any adult cardiac catheterization unit within three years after initiation.
- "(2) There should be a minimum of 150 pediatric cardiac catheterizations performed annually in any unit performing pediatric cardiac catheterizations within three years after initiation.
- "(3) There should be no new cardiac catheterization unit opened in any facility not performing open heart surgery.
- "(4) There should be no additional adult cardiac catheterization unit opened unless the number of studies per year in each existing unit in the health service area(s) is greater than 500 and no additional pediatric unit opened unless the number of studies per year in each existing unit is greater than 250."

Background Because of the medical relationships between open heart surgery and cardiac catheterization services, the two guidelines are discussed together in the

SHP. Cardiologists and heart surgeons must work in close coordination to provide quality care for patients with congenital and acquired heart and artery disease. Both the open heart surgery operating room and the modern cardiac catheterization laboratory require expensive equipment and a highly skilled staff. Safety and efficacy of these units require a case load of adequate size to maintain the skill and efficiency of the staff. Underutilization of these units represent a less efficient use of expensive resources and frequently reflects unnecessary duplication.

In recent years, rapid advancement of techniques have greately expanded services which increase the lifespan and activity levels of patients that were in the past determined to be pre-terminal. Technological advances continue to abound. Cardiac catheterization services have expanded from diagnostic to therapeutic with the angioplasty procedures. With advances in techniques have come sophisticated skills required of medical specialists. Data indicate that the larger the volume of procedures, the lower the risk factor to the patient. Addition of new facilities in the state may lower the volume of procedures at existing facilities.

Current Status Table 15 provides 1982 resource and utilization data for adult open heart surgery and cardiac catheterization for each state planning region (SPR) in Texas. Also included on the table are the average number of procedures per facility, number of facilities meeting the NHPG standards and use rate (procedures/population per 10,000). The average number of open heart procedures per facility exceeds 200 in only 4 SPRs. However, when the standard of a minimum of 200 procedures is applied to individual facilities, twenty-three met this guideline standard. No SPR met the minimum of 350 procedures per unit for additional units.

The average number of cardiac catheterization studies per facilities exceeds 300 in 13 SPR areas. When the standard of a minimum of 300 studies per unit is applied to individual facilities, 43 facilities met this standard. As pointed out in the SHP, only three facilities met the minimum of 500 studies per unit standard for additional units. However, data as to the number of units in each facility may alter this count.

Table 16 provides 1982 resource and utilization data for pediatric heart surgery, open heart surgery and cardiac catheterization services for each SPR. Pediatric heart surgery and cardiac catheterization services were mainly limited to five SPRs (1, 4, 16, 18, and 20). These SPRs appear to be serving as regional referral centers for the state. Table 17 presents a 1982 inventory of both adult and pediatric open heart surgery and cardiac catheterization facilities with utilization data.

Discussion/Conclusions In order to estimate the need for facilities and units for 1989, an estimated inventory of these resources expected to be providing services was prepared by addition of resources for which a CON order has been issued (Table 18) to the 1982 inventory. This inventory is presented in Table 19 together with 1989 population projections and projected number of adult procedures for each SPR. The projected number of procedures was calculated by multiplying the projected 1989 population by the 1982 use rate. While these projections are presented as an estimate of possible demand, they are not intended to be used as determinates in planning local or SPR need for services since many factors other than 1982 usage will affect the need for services such as:

a. Opening of new facilities listed in Table 17 will most likely have an effect upon referral patterns.

- b. Technological advances may change demand for services, i.e., therapeautic catheterization such as angioplasty may increase demand, while bio-medical treatment and development of laser techniques may reduce demand.
- c. SPR 16 currently serves as a world-wide center for open heart surgery services and demand must be adjusted accordingly.

Review of the resources expected to be available in 1989, 1982 usage, and projections of 1989 usage lead to the conclusion that there will be adequate adult resources in 1989. However, service utilization should be closely monitored to determining whether additional units are needed and where any additional facilities should be located.

Review of the pediatric utilization in Tables 16 and 17 indicates that pediatric open heart surgery and cardiac catheterization services have mainly been provided in Potter County in SPR 1, Dallas and Tarrant counties in SPR 4, Harris and Galveston counties in SPR 11, Bexar county in SPR 18, and Nueces county in SPR 20. This leads to the conclusion that these counties are currently serving as regional centers for pediatric services.

The recommendations set forth in the State Health Plan for open heart surgery and cardiac catheterization services call for a Task Force on Regionalization to develop a state plan for regionalization of services and for collection of additional data. Items to be considered by the Task Force should include, but not be limited to:

- a. Establishment of service areas for open heart surgery and cardiac catheterization facilities.
- b. Establishment of quality care assurance criteria to include staffing, equipment and support services requirements.
- c. Study of technological changes that will effect service demand.
- d. Transfer-referral agreements needed between freestanding cardiac catheterization facilities and open heart surgery facilities.
- e. Need for development of open heart surgical teams to provide services in more than one facility.
- f. Need for low cost accommodations to reduce non-medical expenses of care.
- g. Patient needs for transportation.
- h. Need for diagnostic cardiac catheterization units in unserved areas where patients must travel great distances to receive services.
- i. Study of the special needs of pediatric services providers.
- j. Study of special problems of reimbursement for care of the indigent.

The staff of the Bureau of State Health Planning and Resource Development of TDH will continue its efforts to collect data and update the attached tables in order to provide this Task Force with information necessary to accomplish this task. Efforts will be made to determine (1) the number of units within each facility, (2) the location of surgical teams serving more than one hospital and (3) the availability of facility units, i.e., dedicated or multipurpose labs and operating rooms.

RADIATION THERAPY

Guideline 9 and its resource standards are quoted from CFR 42, Part 121 as follows:

Guideline #9 - Radiation therapy

Standards

- 1. "A megavoltage radiation therapy unit should serve a population of at least 150,000 persons and treat at least 300 cancer cases annually, within three years after initiation.
- 2. There should be no additional megavoltage units opened unless each existing megavoltage unit in the health service area(s) is performing at least 6,000 treatments per year.
- 3. Adjustments downward may be justified when travel time to an alternate unit is a serious hardship due to geographic remoteness, based on analyses by the health systems agency."

Background Radiation therapoy is a field within medicine which employs the use of high energy radiation for the treatment of disease, primarily cancer. It may be used in combination with surgery and/or chemotherapy, depending on the characteristics of the tumor or neoplasm. Studies have shown that at least 50% of new cancer patients each year undergo radiation therapy, either alone or in combination with the other treatments.

In recent years, the development of linear accelerators has allowed radiation therapy facilities to provide a broad range of therapeutic energies. High energy units deliver a higher therapeutic dose to the tumor mass with minimized adverse side effects and a more precise therapy beam with less scatter-radiation than Cobalt. Linear accelerators are more costly to purchase, operate and maintain than cobalt However, cobalt units are the unit of choice for certain types of tumors. While the guideline standards address the minimum size population to be served per unit, the minimum number of cancer cases to be treated annually and the minimum level of service expected from each unit, the problem of location of facilities and type of equipment to best serve both the densely populated urban areas and sparsely populated rural areas of Texas is not addressed.

Current Status Table 20 provides 1982 resource and utilization data for each state planning region (SPR) in

Texas. Also included is the number of cancer cases reported on the Cancer Registry in 1982 by health service area (HSA). Table 21 is an inventory of 1982 facilities providing radiation therapy services. This table also provides data concerning type of units in each facility, number of cancer cases and number of treatments.

Figure 1 illustrates service areas for facilities providing radiation therapy services during 1982. The Laredo-Webb county area appears as the only metropolitan area which remained without services.

Discussion/Conclusions In order to estimate the need for facilities and units for 1989, an estimated inventory of these resources expected to be providing services is needed. Known changes in facilities and equipment for which a Certificate of Need order has been issued by THFC are listed in Table 22. These additions and deletions were incorporated into the 1982 inventory of facilities and units to produce Table 23. This estimated 1989 Inventory of Units also provides the megavoltage capacity of units listed in the inventory.

Table 24 provides a camparison of 1982 and estimated 1989 number of units, population and population per unit for each SPR. A projection of the number of units which will be needed in 1989 is provided by dividing the projected population for each SPR by 150,000. However, factors other than simple population to unit ratio will effect the actual number of units needed in a SPR. Facilities which serve as referral centers will of necessity require more units and units with higher megavoltage capacity. However, unnessary duplication of facilities and fragmentation of the patient volume necessary both to support quality care and to provide cost-effective utilization should be avoided.

The projections presented in Table 24 are provided as a guide for planning. However, adjustments must be made based upon local circumstances. Example of adjustments are as follows:

a. SPR 24 in HSA 9 has a widely scatted population and is without a large metropolitan city located within its borders. It is doubtful that this area could support a megavoltage therapy unit with expensive equipment and staff. b. SPR 16, HSA 11, serves as a referral center for the state as a whole and also for out-of-state patients. Number of units to serve this expanded population will exceed that projected for the population of the SPR and justifiably so. M.D. Anderson Cancer Center in Houston, with a total of 9 units and 50,802 treatments in 1982, serves the entire state plus patients from other states and other countries. An earlier study covering a two week period showed that over 50% of its clientele came from outside the SPR.

c. SPR 22 in HSA 5 lies within the 80 mile radius of units

of SPR 4. Many cancer patients in SPR 22 are referred by their family physicians to facilities in SPR 4, with its greater capacity for care.

- 2. Harrington Cancer Center in SPR 1, HSA 1, which has been in service for less than three years and for which utilization data is not available, services as a referral center for SPR 1. It is anticipated that many out-of-state patients will seek its services justifying the need for additional units.
- e. Existence of or planned opening of freestanding single-unit facilities in SPRs 6, 10, 11 and 17 result in the estimated number of facilities exceeding the projected need for units.
- f. The CON approved order for an 18 megavoltage unit in SPR 15 will establish this area as an area for out-of-SPR and out-of-state referrals. The addition raises the total units estimated for 1989 above the projected needed units based on population only.

In order to properly project the need for radiation therapy units across the state, there is a need for additional data. Examples of desired data are as follows:

- a. Cancer incidence rates for each SPR area.
- b. Number of cancer cases treated annually.
- c. County of residence of patients receiving services.
- d. Number and location of professional medical personnel, i.e., oncologists, radiologists, etc.

The above examples illustrate the need for planning of facilities and units based upon analysis of each SPR rather than a simple population to unit ratio.

The recommendations set forth in the State Health Plan for radiation therapy call for a Task Force on Regionalization to develop a state plan for regionalization of radiation therapy services and collection of additional data. Items to be considered should include, but not be limited to:

- a. Levels of care to be assigned to facilities together with staffing and equipment criteria for determining levels of care.
- b. The geographic location of upper level facilities.
- c. Transfer-referral agreements needed to assure patient access to quality care based on patient need.
- d. Patient needs for transportation.
- e. Need for low cost accommodations for patients and family to reduce non-medical expenses of care.

The staff of the Bureau of State Health Planning and Resource Development of TDH will continue its efforts to collect data and update the attached tables in order to provide this Task Force with the information necessary to accomplish this task.

END-STAGE RENAL DISEASE (ESRD)

Guideline 11 and its resource standards are quoted from CFR 42, Part 121 as follows:

Standard

"The Health Systems Plans established by Health Systems Agencies should be consistent with standards and procedures contained in DHEW regulations governing conditions for covering of suppliers of end-stage renal disease services, 20 CFR, Part 405, Subpart U."

Sections 405.2122 and 405.2130 which list minimum utilization rates are also quoted as follows:

Subsection 405.2122 Types and duration of classification according to utilization rates.

An ESRD facility that meets all the other conditions for coverage of ESRD services will be classified according to its utilization rate(s) as follows: Unconditional status, conditional status, exception status, or not eligible for reimbursement for that ESRD service. Such classification will be based on previously reported utilization data (see Subsection 405.2124, except as specified in paragraph (a) of this section), and will be effective until notification of subsequent classification occurs. (See Subsection 405.2123 for reporting requirements; Subsection 405.2124 for method of calculating rates; Subsection 405.2130 for specific standards.)

- (a) Initial classification.
- (1) An ESRD facility that has not previously participated in the ESRD program will be granted conditional status if it submits a written plan, detailing how it will achieve the utilization rates for conditional status by the end of the second calendar year of its operation under the ESRD program, and the rates required for unconditional status by the end of its fourth calendar year of operation.
- (2) The ESRD facility's performance will be evaluated at the end of the first calendar year to ascertain whether it is properly implementing the plan.
- (b) Exception status.
- (1) A renal dialysis center or a renal dialysis facility that does not meet the minimal utilization rate for unconditional or conditional status may be approved by the Secretary for a time limited exception status if:
- (i) It meets all other conditions for coverage under this subpart;
- (ii) It is unable to meet the minimal utilization rate because it lacks a sufficient number of patients and is located in an area without a sufficient population base to support a center or facility which would meet the rate; and
- (iii) Its absence would adversely affect the achievement of ESRD program objectives.

- (2) A hospital that furnishes renal transplantation services primarily to pediatric patients and is approved as a renal dialysis center under this subpart, but does not meet the utilization standards prescribed in Subsection 405.2130(a), may be approved by the Secretary for a time limited exception status if:
- (i) It meets all other conditions for coverage as a renal tranplantaton center;
- (ii) The surgery is performed under the direct supervision of a qualified transplantation surgeon (Subsection 405.2102 (r)(7)) who is also performing renal transplantation surgery at an approved renal transplantation center that is primarily oriented to adult nephrology;
- (iii) It has an agreement, with the other hospital serviced by the surgeon, for sharing limited resources that are needed for kidney transplantation; and
- (iv) There are pediatric patients who need the surgery and who cannot obtain it from any other hospital located within a reasonable distance.

Subsection 405.2130 Condition: Minimal utilization rates.

The ESRD facility meets the applicable minimal utilization rate(s) indicated below for unconditional or conditional status, unless granted exception status in accordance with Subsection 405.2122(b);

- (a) Standard: Renal Transplantation Center.
- (1) Unconditional status: 15 or more transplants performed annually.
- (2) Conditional status: 7 to 14 transplants performed annually.
- (b) Standard: Dialysis facilities or centers performing greater than 20 percent of their dialyses on outpatients.
- (1) For any facility located within a standard metropolitan statistical area of 500,000 population or greater:
- (i) Unconditional status 6 or more dialysis stations with performance of an average of 4.5 or more dialyses per station per week;
- (ii) Conditional status 6 or more dialysis stations with performance of an average of between 4.0 and 4.5 dialyses per station per week or 4 or 5 dialysis stations with performance of an average of 4.5 or more dialyses per station per week.
- (2) For any facility located in a standard metropolitan statistical area of less than 500,000 population, or in an area not included in a standard metropolitan statistical area.
- (i) Unconditional status 3 or more dialysis stations with performance of an average of 4.0 or more dialyses per station per week;
- (ii) Conditional status 2 dialysis stations with performance of an average of 4.0 or more dialyses per station per week.

- (c) Standard: Renal dialysis centers performing 20 percent or less of their dialyses on outpatients:
- (1) Unconditional status 3 or more dialysis stations with performance of an average of 4.0 or more dialyses per station per week;
- (2) Conditional status 2 dialysis stations with performance of an average of 4.0 or more dialyses per station per week.
- (d) Self-dialysis training stations which were utilized to successfully train at least six self-dialysis patients per station per calendar year and the dialyses performed on these stations may be excluded from the calculation of utilization rates.
- (41 FR 22511, June 3, 1976. Redesignated at 42 FR 52826, Sept. 30, 1977, and amended at 43 FR 48951, Oct. 19, 1978).

The NHPG Resource Standard cited above was discussed in summary form at the statewide level in Chapter 9 of the SHP. The tables to follow provide additional data at the health service area (HSA) and the state planning region (SPR) levels. They will allow initial evaluation regarding the status of ESRD services in specific areas of the State. They should also provide information to support the initial efforts of the Task Force on Regionalization of Specialized Medical Services discussed regarding the ESRD recommendations in Chapter 9 of the SHP.

^{*}Fourteen new stations to be added in Dallas County in 1985.

FIGURE 2

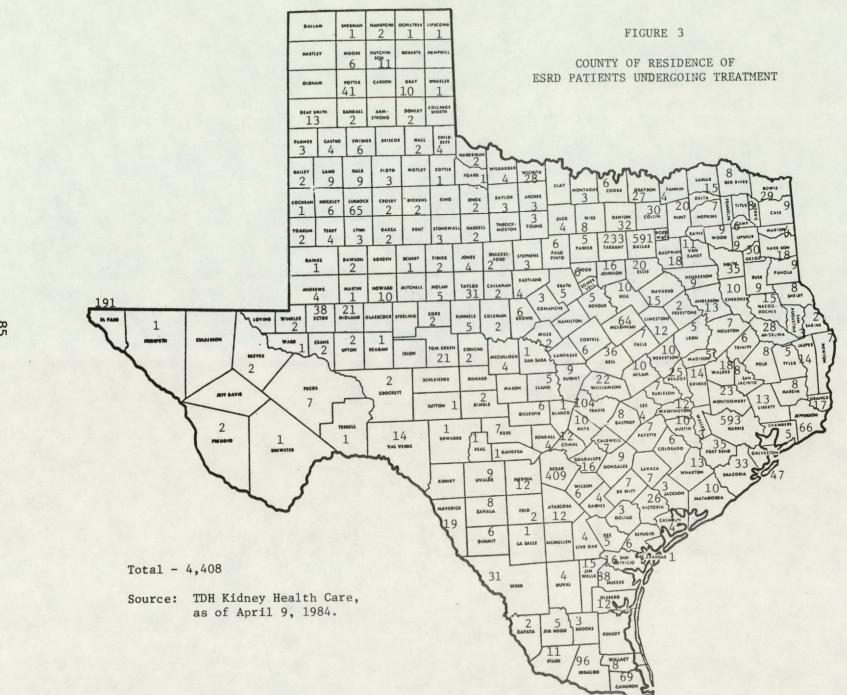

EXHIBIT 4

ESTIMATE OF DIALYSIS STATION REQUIREMENTS

- Operation of unit 12 16 hours per day times6 days per week yields:
- 2. 72 96 hours available per week.
- 3. 4 hours per treatment per patient times
 - 3 treatments per week yields
 - 12 hours per patient per week.
- 4. Therefore 72 96 hours per week divided by
 - 12 hours per patient per week yields
- 6 8 patients per week capacity.
 5. Thus 300 added patients per year divided by
- 6. Yields 50 37.5 more dialysis stations per year.

NURSING HOME BED NEED PROJECTIONS

INTRODUCTION

The Texas Department of Health as the SHPDA has been charged with responsibility for developing a methodology for determining the number of nursing home beds that will be needed in Texas in future years. In 1982 in Texas, there were 1,004 nursing and custodial homes with a total of 101,511 licensed beds. These facilities provided 29.7 million days of care with an average daily census of 81,611. There were 1.4 million persons 65 years of age or older and a bed to population ratio of 70.0 per 1,000 persons age 65 or older. In 1984 the number of facilities remained the same, 1,004, the number of beds declined slightly to 101,291, and the bed to population ratio declined to 65.7.

The nursing home bed need methodology developed by the SHPDA and adopted by the SHCC is virtually the same use rate methodology used in projecting bed need for short term care hospitals. In its simplest form, the application of this methodology involves four steps. First, current use rates are determined, i.e., the number of patient days generated for every 1,000 persons in the population is determined. This use rate is then applied to population estimates for the projection year to determine the number of patient days that would be generated in that year if the current use rate remained constant. These projected patient days are then divided by 365 to provide a projected average daily census. Finally, the average daily census is divided by the desired occupancy rate to give an estimate of the number of beds that will be needed. This four step process is summarized in Exhibit 2 in the short term care section.

In applying the use rate methodology to nursing home bed projections, several changes to the basic methodology, as described above, were made: (1) use rates were determined for counties based upon patient days generated by residents of that county and (2) separate use rates were projected for persons less than 65 years of age, persons age 65 to 74 and persons 75 years of age and older. In determining current use rates and projecting needed beds, no distinction was made for type of care, i.e., patient days generated by all types of care (excluding ICF-MR) were considered together in projecting needed beds.

METHODOLOGY

Description of Data Bases The Nursing Home Patient Origin Survey (NHPOS) was conducted in the fall of 1983. All nursing homes in the State of Texas were asked to provide information on their patient census of August 1, 1983 (excluding ICF-MR patients). Information was collected on patient's county of residence and age (less than 65, 65-74, or 75 and older).

Nine hundred forty-six nursing homes (95%) provided information for the NHPOS. Rather than eliminate patient days generated by facilities that did not participate in the NHPOS, it was decided to use the origin pattern of a similarly composed facility in close proximity to the non-reporting facility.

Although this procedure will generate some error, it was felt that the error would be considerably less than that created by ignoring patient days generated by non-reporting facilities.

The TDH also requests all nursing homes to complete the Nursing and Custodial Home Data Questionnaire each year. This instrument collects data on the number of patient days accumulated over the year for several levels of care. In the methodology presented in this paper, patient days accumulated in all levels of care (nursing and custodial) were utilized with the exception of ICF-MR days of care.

Population figures used in the bed need methodology are from TDH population projections. These projections are based on the assumption that the in-migration rates of the 1970's will continue through the 1980's.

Computation of Use Rates The NHPOS was used to determine the percentage of a facility's total patient days to allocate back to each county based on patient residence. In other words, using the NHPOS a pattern was obtained for each facility showing the percentage of that facility's patients that came from each county. This pattern was then used for allocating patient days reported in the Nursing and Custodial Home Data Questionnaire to counties. For example, if 10% of facility #1's patients came from county #1, then 10% of the patient days reported for facility #1 on the Nursing and Custodial Home Data Questionnaire were allotted to county #1.

Information on patient age collected in the NHPOS was retained when allocating patient days back to counties. That is, if the NHPOS indicated that 10% of facility #1's admissions originated in county #1 and that 2% were between the ages of 65-74 and 8% were 75 years of age or older, then 2% of facility #1's patient days would be allocated to the 65-74 year age group in county #1 and 8% of the patient days for facility #1 would be allocated to the 75 and older age group for county #1.

NHPOS admissions of out-of-state residents were added to admissions for the county in which the facility was located. Therefore, county estimates of 1982 patient days derived from these admission patterns included not only patient days generated by county residents, but also patient days generated in that county's facilities by out-of-state residents. Otherwise, patient days generated by out-of-state residents would not have been considered and estimates of patient days for 1989 would, therefore, have been under-estimates.

Using this method, three patient day estimates were obtained for each county: one for the under 65 age population, one for the 65-74 age population and one for the 75 and older age population. These patient day estimates were then divided by appropriate county population figures to provide use rates. For example, if 500 patient days were generated by the 65-74 year age group for county #1 and the 65-74 year old population for this county was 10,000, the use rate would be 500/10,000 (.05) or 50 patient days generated per 1,000 population age 65-74.

Projection of Patient Days The three use rates generated for each county in 1982 were applied to 1989 county population projections to obtain estimates of patient days generated in 1989. If any of the 1982 use rates for a county were based on a population less than 100, the average use rate for the state in that particular age group was substituted. These substitutions were made because populations of less than 100 were judged unlikely to produce stable use rates and the average rate for the State of Texas for that category appeared to be the most appropriate substitute.

Finally, patient day projections for counties were aggregated to the state planning region (SPR), health service area (HSA) and state levels.

Projection of Beds To convert 1989 patient day projections for the 24 SPRs to needed beds, appropriate occupancy rates had to be selected for the SPRs. Because of the differences in facility size and occupancy rate, facility occupancy rates could not be simply averaged for each SPR. Rather a method for averaging occupancies had to be selected that took into account differences in facility size. Accordingly, occupancy rates were weighted by the number of beds in a facility. Weighting consisted of multiplying each facility's occupancy rate by the number of beds, summing these products and then dividing the sum by the total number of beds in the area. An example is provided in Exhibit 3 in the Chapter 9 Annex.

In computing these average weighted occupancy rates for SPRs, a minimum acceptable occupancy target of 75% was applied to all facilities. That is, when computing the occupancy rates, facilities with occupancies below 75% had 75% substituted for their occupancy rates. (Approximately 25% of the facilities had occupancies below 75%.) Beds derived from these average weighted occupancy rates represent a maximum number or upper range of nursing-custodial beds that should be needed in 1989.

A second method was used to obtain higher occupancy rates and consequently a lower range of projected beds. This method was used to set a goal for each SPR which the SPR should strive to achieve by 1989. Again, the minimum occupancy was set at 75%. Ten percent was then added to the 1982 occupancy for each facility. A maximum occupancy was also instituted; facilities whose weighted occupancy plus 10% was greater than 95% were capped or set back to 95%. (Because of normal turnover, occupancies greater than 95% were considered unreasonably high.)

RESULTS

Table 29 in the Chapter 9 Annex provides utilization data and shows the number of nursing-custodial beds in existence in 1982 and Table 30 shows the number of beds as of February 29, 1984. There was a slight decrease in beds over this time period, from 101,511 beds in 1982 to 100,749 beds in 1984 and a decrease in the 65+ population ratio, from 70.0 to 65.4 beds per 1,000. Table 31 in the Annex shows the nursing and custodial bed ranges projected for 1989 for the 24 SPRs. SPR projections are also added together to provide

projections for the HSAs and for the state. Using weighted 1982 occupancy rates with a 75% minimum occupancy, 118,943 beds are projected for 1989, 14,467 more beds than are licensed, CON approved or under construction in 1984 (See Table 32 in the Annex). This should represent the upper range or maximum number of nursing and custodial beds needed in 1989.

A second set of bed projections, obtained by adding 10% to the occupancy rates used to derive upper range projections, indicates that only 111,007 beds will be needed in 1989, 6,531 more beds than are licensed, CON approved or under construction in 1984. These figures represent the lower range or goals toward which the state and each individual SPR should strive.

It should be recognized that mathematically derived estimates of bed need several years in the future should not be considered as absolutes. To the contrary, they should be accepted for what they are, i.e., best estimates of or guidelines for such future needs. Unique local needs or substantial change in prevailing conditions will frequently outweigh a long range projection estimate in a given contemporary situation.

Table 33 in the Annex shows facility data for all facilities as of February 29, 1984.

DISCUSSION

These bed need projections are based upon demand for services rather than actual need for services. Attempting to determine actual need would be an enormous and questionable undertaking. Even if need could be adequately defined and measured, it would be of little use in projecting beds for 1989 unless demand could be adjusted to equal need.

The decision on where to place nursing home beds projected for an area should not be based entirely on bed need generated by area residents. The NHPOS indicates that a number of elderly patients travel to other counties to enter nursing homes, even when facilities are available in their county of residence. Therefore, to project beds strictly on the basis of county of residence when some persons choose voluntarily to leave that county would be inappropriate.

Although bed projections by level of care would be useful for planning, such projections cannot be provided at this time. Information on levels of care is not available in the NHPOS; therefore, patient days could not be apportioned back to counties of residence by level of care. Furthermore, the proportion of skilled beds to intermediate beds is rapidly changing because of the institution of DRGs. Finally, there is a possibility that the ICF-II level of care will be re-instated by the Texas Legislature. Therefore, bed projections based on the number of skilled and intermediate patient days accumulated in 1982 would probably be quite inappropriate for 1989.

Many factors will effect nursing home utilization over the next few years, factors that are not considered in the use rate methodology presented here. Sufficient information does not exist at the time of this report to allow quantitative adjustments to be made to utilization because of these factors. Therefore, a brief discussion of the anticipated effect of these factors on nursing home utilization is presented.

Perhaps the major factor which has and will continue to effect nursing home utilization was the capping of Federal Medicaid funds. Since approximately 80% of all nursing home patient days are paid for from Medicaid funds, any limitation in availability of funding together with increasing costs of care will reduce the number of patient days that can be reimbursed. TDHR has and will continue to tighten patient eligibility requirements as funds are limited.

The discontinuance of funds for new patients at the ICF-II, custodial care, level has reduced the number of patients eligible for Medicaid reimbursed care. Elderly who would have formerly been eligible for custodial care may now be choosing to move to retirement villages or personal care homes which are becoming more available. Expansion in this area is evidenced by a conversion of approximately 787 nursing home beds to personal home beds during 1983. TDHR funds a supervised living project which reimburses care in personal care homes using state funds only.

The effect of expanded home health services is still undetermined. These services have become more available since a certificate of need is no longer required. Attempts will continue to be made to measure the effect of care provided by home health agencies on the need for nursing home beds. This will be done as more information regarding the availability, distribution and utilization of such services becomes available.
