GRAIN SORGHUM PERFORMANCE TESTS IN TEXAS--1992

D. R. Pietsch, Randy Gaas, D. T. Rosenow, F. R. Miller, and G. C. Peterson

INTRODUCTION

Grain sorghum continues to be a major commodity in Texas. From year to year, acreage in Texas has fluctuated based on rainfall patterns, climatic conditions, participation in various government supported programs, and price differential between commodities. This year 4.7 million acres were harvested by Texas farmers. This acreage represents a 62.1% increase over 1991 when 2.9 million acres were harvested. The Northern and Southern High Plains accounted for 52.1% of the State acreage as represented by Texas Crop Reporting Districts 1-N, 1-S, 2-N and 2-S as shown in Figure 1. The increase of acreage in these Reporting Districts can be attributed to planting grain sorghum on cotton acreage that was lost due to prolonged periods of heavy rainfall, flooding, and/or hail damage. District 1-S (Southern High Plains) had the largest increase of acreage from 165,000 acres in 1991 to 1.32 million acres in 1992 or a 700% increase. This District also accounted for 28.1% of the State's total acreage in 1992.

This year due to the increase of acreage, it is estimated that Texas farmers will produce 157.92 million cwt. of grain sorghum which is the most since 1982. With the increase in acreage, the State mean yield is estimated to decrease from 3,416 lb/A in 1991 to 3,360 lb/A in 1992. Due to the efforts of grain sorghum breeders, farmers now have an opportunity to plant white or cream sorghums in addition to the traditional red or bronze colored sorghums without sacrificing yields. In addition to the white or cream colored seed, sorghums that have straw colored glumes, tan plant color, and superior weathering ability will definitely have a marketing advantage. Farmers may have the opportunity to use different marketing strategies to enhance cash flow. Continued emphasis and efforts will be employed in using sorghum for food and animal feed both domestically and internationally. The white or light cream colored sorghums have dual advantages in animal feeds and human foods. These sorghums produce formulated feeds with significantly lighter color and overall improved appearance, which will benefit the U.S. feeder. In addition, the light colored sorghums will enhance export competitiveness of U.S. sorghum in world markets. The potential for using sorghum for food in the U.S. has never been realized, in part because we have never produced consistently sufficient quantities of high quality sorghum for the industry to use. The advantages of white grain types with tan plant color can be achieved with appropriate hybrids for feed and food quality that have the necessary agronomics, yield potential, and adaptation to Texas environmental conditions.

GRAIN SORGHUM PERFORMANCE TESTING IN TEXAS

This report presents the results of five irrigated and five non-irrigated grain sorghum performance tests. Approximate locations of test sites are shown in Figure 2 and represent the major grain sorghum production areas in Texas.

In addition, results of supplementary grain sorghum tests conducted at Runnels County, Halfway, Texas, and Lamesa, Texas are reported. The Runnels County test was conducted by the Winters, Texas Young Farmers Organization. The Halfway test was conducted separately from the State corn and grain sorghum performance tests. It was conducted as part of the sorghum and corn variety testing program at the Texas Agricultural Experiment Station (TAES) at Halfway in cooperation with the High Plains Research Foundation. The Lamesa Test was conducted by personnel of the Texas Agricultural Experiment Station, Lubbock, Texas. Results from these tests will be useful in determining the adaptability of grain sorghum in this area.

Grain sorghum seed producers and TAES plant breeders enter sorghum hybrids in the State testing program at several locations for evaluation under different and changing environmental conditions. Entry of a hybrid at a given location does not imply that it is recommended for that area. Data contained herein are a measure of performance of grain sorghum hybrids planted during a particular season at the location shown.

Selection of a grain sorghum hybrid is a basic management decision. Yield is the predominant criterion of a hybrid, but other agronomic information as provided in this report should be evaluated before a final decision is made.

ENTRIES

Official entry forms are mailed in December to everyone known to be interested in the grain sorghum testing program. Forms include the necessary information to make entries in any or all of the locations to be planted. No restrictions are placed on the number of hybrids a company may enter. Experimental materials are also accepted. All hybrids are entered on a fee basis under their brand name or number designation (Table 1). In addition, standard check hybrids are entered by TAES. After the test plantings are established, each participant receives a location sketch and planting plan for observation of the block during the growing season. After the data has been statistically analyzed, results from each individual test site are made available to participating companies, farmers, county extension agents, test cooperators, and anyone else who requests the information in a timely manner. A detailed publication combining all test results is produced at a later date.

FIELD-PLOT TECHNIQUE

Excessive amounts of seed were packaged and planted at all locations by one of the following methods:

1. Hand dropped through planter at Hondo, Danevang, Thrall, McKinney, and Dumas.
2. Cone planter at Weslaco, Gregory, College Station, and Lubbock.

After emergence, seedlings in each plot were hand thinned to a uniform spacing for a plant population recommended in the area.

Cultural practices were those adapted for general use in the area as determined by the cooperator. Field data were recorded at the appropriate time and other data collected at harvest. All locations, except the Lubbock Dryland Test were harvested with a MF8 combine modified for plot harvesting. Plot weight, bushel weight, and moisture were calculated with electronic equipment mounted on the combine. The Lubbock test was hand harvested and threshed by running samples through a plot combine.

DATA

The following data are reported and may or may not be quoted in this report for each respective location:

Grain color--designated by a respective seed company for that particular hybrid.

R=red, Br=brown, Bz=bronze, Rt=red translucent, W=white, Wt=white translucent, Ct=cream translucent, Y=yellow.

Plant color--designated by a respective seed company for that particular hybrid. T=tan, R=red, P=purple.

Maturity class--maturity designated by a respective seed company for that particular hybrid. Early (E), medium-early (ME), medium (M), medium-late (ML), and late (L) designations are used.

Days to 50 percent flower--number of days from planting to, and including the day that an estimated 50 percent of the plants have reached anthesis.

Plant height--average inches from the ground to the tip of the panicle.

Panicle exertion--average inches from the flag leaf to the base of the panicle.

Panicle length--number of inches from base of panicle to tip of panicle.

Test weight--pounds per bushel of grain determined from all replications.

Bird damage--visual rating or percentage, not used in yield calculations.

Lodging--visual rating or percentage, not used in yield calculations.

Midge damage--percentage estimated but not used in yield calculations.

Leaf and Plant Death Rating--visual estimate at harvest : 1= no leaf and plant death 5 = leaves and stem completely dead

Desirability Rating--1=very good, 2=good, 3=average, 4=poor, 5=very poor

Check hybrids--those hybrids that are commonly used in a respective area that were not entered by a commercial company. They were included in the test on the basis of a survey taken by area county agents, farmers, and seed dealers.

Yield--determined as follows: plot weight x acre conversion factor x moisture correction factor. All yields are corrected to 13 percent moisture.

Statistical significance--shown for the yield of hybrids within each maturity group. Yields followed by the same letter are not significantly different at the 0.05 alpha level based on Duncan's multiple range test.

LSD--Least Significant Difference. A statistical tool measuring the difference between two entries. When two entries are compared and the difference between them is greater than the LSD, then the entries are judged to be significantly different.

CV--Coefficient of Variation. A statistical tool used to estimate the degree of confidence one may have in published data from replicated tests. C.V.'s below 15% generally indicate reliable, uniform data whereas C.V.'s over 15% are common and may lack precision, but the data may be useful for comparison.

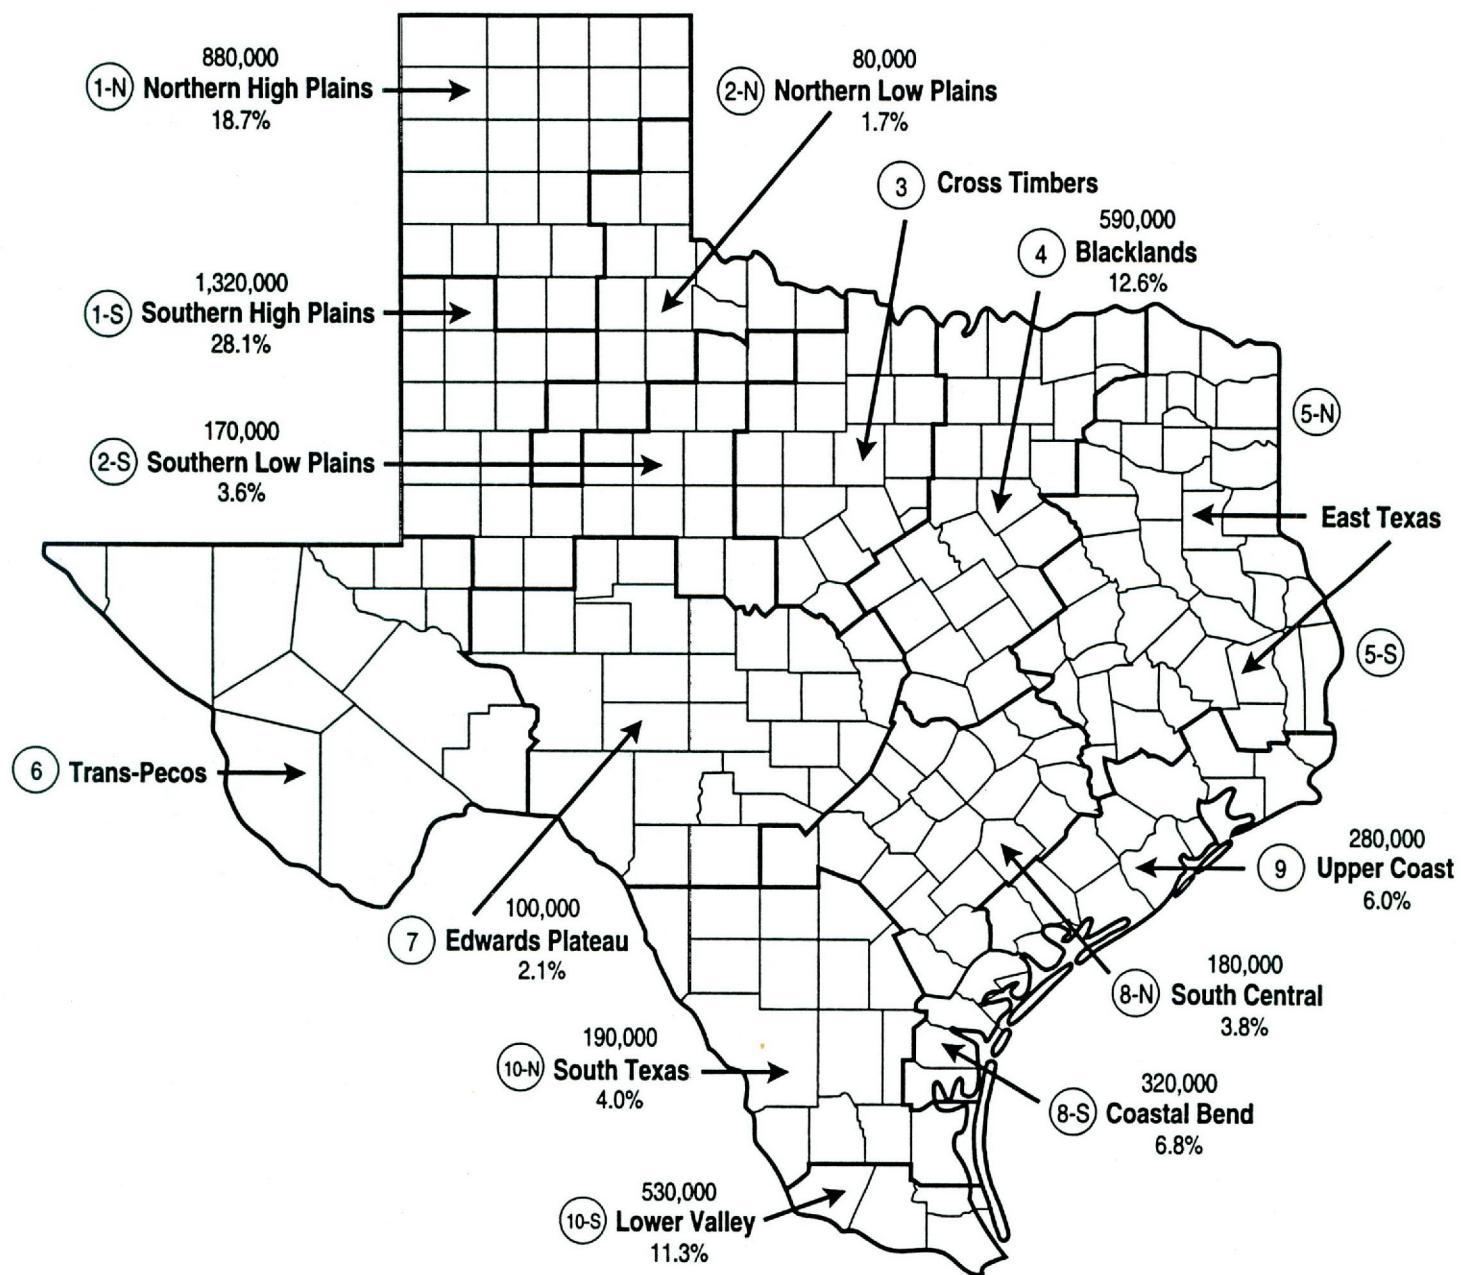

RESULTS

1992 was a very good year for conducting performance tests. The season started out with abundant moisture from record rainfall received during the fall and winter months. Planting was delayed at several locations due to wet soil conditions but overall, optimum planting dates were secured. The Thrall test was re-planted due to very poor stands attained after emergence. Very good yields were attained after the test was re-planted but the incidence of lodging was high in some hybrids due to charcoal rot. Outstanding yields were secured at McKinney, Lubbock Irrigated, and Dumas. General comments follow each test site and gives a brief summary of conditions during the growing season.

Results for each of the performance test locations are presented as follows:

1. Tables 2-11 summarize agronomic and test data information.
2. Tables 2A-11A present all performance test data obtained for hybrids entered at the respective locations. Some of these hybrids are in the experimental stage and seeds are not yet available in quantities for farm planting.
3. Tables 2B-11B are summaries of hybrids showing test yields and test ranks at respective locations for given time periods. The summaries are helpful in selection of hybrids for a particular area. Those hybrids not entered for a respective year are designated (--). Hybrids with same yields were ranked by computer.
4. Tables S1-S2 gives agronomic and test results from supplementary grain sorghum tests conducted by the Runnels County Young Farmers Organization of Winters, Texas.
5. Tables S3-S4 gives results of a supplementary grain sorghum variety test conducted at Halfway, Texas, in cooperation with the High Plains Research Foundation.
6. Tables S5-S6 gives results of a supplementary grain sorghum test conducted at Lamesa, Texas.

Figure 1. Acres and Percentage of Grain Sorghum Acreage Harvested by Texas Crop Reporting Districts, 1992 (1).

- NOTES:
- The figure below each crop reporting district is that district's percentage of the total harvested sorghum in Texas.
 - The circled figure is the number of each district.
 - The figure above the district name is the total harvested acres for that district.
 - The districts with no acreage presented are not considered major sorghum production areas. Grouped together, these districts account for 60,000 acres, or 1.3 percent of state acreage (1).

TABLE 2.

AGRONOMIC AND TEST INFORMATION: WESLACO

TEST:	1992 Irrigated Grain Sorghum Performance Test
LOCATION:	Texas A&M University Research and Extension Center, Weslaco, Texas
COOPERATORS:	Ralph Morgan, John Drawe, Ray Castaneda, and Dennis Pietsch
SOIL TYPE:	Raymondville clay loam
ROW WIDTH:	30"
PREVIOUS CROP:	Cotton
LAND PREPARATION:	Disked, chiseled, disked, bedded
DATE PLANTED:	2-28&29-92
DATE THINNED:	3-25-92; thinned to approximately 5 plants/foot
PLOT LENGTH:	30'
FERTILIZER:	160-0-0; applied 80 lb N as liquid 32-0-0 on 2-14-92, and 80 lb N as liquid 32-0-0 on 4-9-92
HERBICIDE:	4 pt/A AATREX 4L (Atrazine) on 2-29-92
INSECTICIDE:	4 oz/A of Di-Syston on 3-26-92 for yellow sugarcane aphids; 5 oz/A of Lorsban for midge control on 5-20
RAINFALL:	January = 3.89"; February = 2.78"; March = 0.15"; April = 3.80"; May = 4.56"; June = 0.00"; July = 0.12"; Total = 15.3"
IRRIGATIONS:	One on 3-3-92 to insure proper germination
DATE HARVESTED:	7-7-92 with a MF8 plot combine
SIZE HARVESTED PLOT:	Two rows, each 30' long
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	85
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
TEST MEAN:	5,178 lb/A; yields corrected to 13% moisture
TEST C.V.:	7.1 percent

GENERAL INFORMATION: Grain sorghum is a major commodity in the Rio Grande Valley of Texas as represented by Texas Crop Reporting District 10-S. This year according to the Texas Agricultural Statistics Service, 530,000 acres of grain sorghum were planted in this District as compared to 286,000 acres in 1991. This accounts for 11.3% of the total Texas acreage which is estimated to be 4.7 million acres.

Conditions were not favorable for maximum grain sorghum production at this test site as was the case throughout the region. A combination of problems throughout the growing season probably affected potential yields. Although a near-optimum planting date was secured, cool damp weather hampered seedling emergence thus retarding early plant growth. At thinning, yellow sugarcane aphids were observed in the test block resulting in a slight reduction of plant stands. The test block was sprayed with an insecticide to control the pest. Maize Dwarf Mosaic Virus (MDMV) was observed in the test block and may have affected yields. Visual ratings for MDMV were taken by Ralph Morgan on June 8. Ratings are available from the Crop Testing Personnel upon request. Abundant rainfall during the flowering stage in addition to the high number of overcast days were contributing factors that also affected final yields. Although this is designated as an irrigated test site, only one irrigation was applied to the test block on March 3 which insured germination after planting. Due to above normal rainfall, no other irrigations were applied during the growing season.

The test mean yield was only 5,178 lb/A compared to the past 10-year average of 6,718 lb/A . Only two hybrids in the test produced over 6,000 lb/A.

Sometimes, after we have completed our test design and randomization, we receive late entries from a company desiring to have entries included in the performance test. These entries are usually planted on border rows and not replicated within the test. Such was the case with entries submitted by Kelly Green Seed Co. Although these hybrids were planted at the same time, the potential of the hybrids may not be reflected when compared to those randomized within the block.

TABLE 3.

AGRONOMIC AND TEST INFORMATION: GREGORY

TEST:	1992 Dryland Grain Sorghum Performance Test
LOCATION:	John Hunt's Farm, San Patricio County, Gregory, Texas
COOPERATORS:	Pustjevosky and Sons, Darwin Anderson, Dennis Pietsch, Randy Gaas, Leon Synatschk, and Kenneth Schaefer
SOIL TYPE:	Victoria clay
ROW WIDTH:	38"
PREVIOUS CROP:	Cotton
LAND PREPARATION:	Plowed stalks with a Lehman plow, bedded (2)
DATE PLANTED:	3-2-92 with cone planter
DATE THINNED:	3-26-92; approximately 4-5 plants/foot
PLOT LENGTH:	26.5'
FERTILIZER:	Applied 300 lb/A of liquid 20-15-0 in Fall '91
HERBICIDE:	Banded 1 qt/A AAtrex 4L (atrazine) when grain sorghum was 4-5" tall
INSECTICIDE:	Applied 6 lb/A Furdan at planting.
RAINFALL:	From January 1 to mid-May, approximately 50 inches of rainfall were recorded. June and July were dry.
IRRIGATIONS:	None
DATE HARVESTED:	7-16-92 with a MF8 plot combine
SIZE HARVESTED PLOT:	2 rows x 26.5'
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	74
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
TEST MEAN:	4,019 lb/A; yields corrected to 13% moisture
TEST C.V.:	10.7 percent

GENERAL INFORMATION: Average yields were attained at this test site despite record setting rainfall in the Coastal Bend area. According to rainfall records, approximately 50 inches of rainfall were recorded from January to mid-May at the test block.

Despite the abundant rainfall, an optimum planting date was secured and seedling emergence was rapid. Excellent plant stands were attained after thinning. At thinning, yellow sugarcane aphids, greenbugs, and chinch bugs were observed but the incidence was low; however, a heavy rain shortly after thinning eliminated the need of spraying. Excellent plant growth and development resulted from surface and subsoil moisture, but hot and dry weather conditions prevailed in June and July thus reducing potential yields.

This was the first year a mechanized plot harvester was used to harvest the test block. The MF8 plot combine harvested two rows, 26.5 feet long with plot weight, test weight, and moisture determined with electronic equipment mounted on the combine. The test mean yield was 4,109 lb/A compared to the past five year average of 3,936 lb/A. The following Table gives agronomic data for the test. The incidence of bird and midge damage was low with the range being from 0 to 7.5 percent and from 0 to 15 percent respectively. Excellent bushel weights were recorded with the range being from 55.5 to 61.2 lb/bu.

Test Mean = 4019 Test C. V. = 10.7 LSD .05 = 695.0

Note 1: The ANOVA procedure was used for statistical analysis.

Note 2: Hybrid names starting or ending with an "X" denote a commercial experimental. Hybrids entered by the Texas Agricultural Experiment Station are either in the experimental stage or being tested as experimental check hybrids. Individuals may contact respective seed companies for the availability of planting seed for the upcoming crop year.

1 Warner W-917-E, Pioneer 8379 and ORO Hybrids ORO Edge were entered as commercial check hybrids at our discretion. They are intended to be used for comparison purposes only.

2 Grain color designated by respective seed companies: R=Red Br=Brown Bz=Bronze Rt=Red translucent W=White Wt=White translucent Ct=Cream Translucent.

Table 3A. (CONTINUED)

3 Plant color designated by respective seed companies: T=Tan R=Red P=Purple. Those hybrids designated with an asterisk (*) indicates company did not submit plant color.

4 Maturity classification for hybrids designated by the respective seed companies: E=Early M=Medium ML=Medium Late L=Late.

5 Desirability rating: 1=very good 2=good 3=average 4=poor 5=very poor.

6 Duncan's multiple range test was used at the .05 level.

TABLE 4.

AGRONOMIC AND TEST INFORMATION: HONDO

TEST:	1992 Irrigated Grain Sorghum Performance Test
LOCATION:	Vandenburg Farms; Wayne and Pat Stein, Hondo, Texas
COOPERATORS:	Wayne and Pat Stein, Wayne Scholtz, John Northcut, Dennis Pietsch, Randy Gaas, and Leon Synatschk
SOIL TYPE:	Knippa clay
ROW WIDTH:	38"
PREVIOUS CROP:	Cotton
LAND PREPARATION:	Disked twice in September, chiseled in November, bedded, and applied fertilizer in December
DATE PLANTED:	3-11-92, by hand, using JD80 Planter
DATE THINNED:	4-2-92, thinned by hand to approximately 5-6 plants/foot
PLOT LENGTH:	25'
FERTILIZER:	Applied 180 lb/A of 8-24-0-5 at bedding, and 120 lb/A of 82-0-0 prior to planting.
HERBICIDE:	None
INSECTICIDE:	3.5 lb/A of Counter (terbufos)
RAINFALL:	Approximately 20 inches
IRRIGATIONS:	1 application of approximately 2" at pre-boot stage
DATE HARVESTED:	7-28-92 with a MF 8 plot combine
SIZE HARVESTED PLOT:	2 rows, 25 feet long
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	62
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
TEST MEAN:	5,612 lb/A; yields corrected to 13% moisture
TEST C.V.:	6.5 %

GENERAL INFORMATION: Outstanding yields were attained at this test site due to excellent soil conditions at planting and timely rainfall throughout the growing season. The season started with a full soil moisture profile from fall and winter rains. A near-optimum planting date was secured with excellent plant stands achieved after thinning. Due to timely rainfall, only one irrigation was applied to the test block (pre-boot stage) which insured continuous plant growth and development.

Flowering notes were taken at the appropriate time with days to 50% flower ranging from 75 to 86 days. The incidence of midge damage was low with only six plots having minimal damage. Bird damage was not significant. Lodging was not observed in the test block.

The test mean yield was 5,612 lb/A compared to the past five-year average of 4,950 lb/A. Twenty-two hybrids in the test produced over 6,000 lb/A.

Test Mean = 5,612 Test C. V. = 6.5 LSD .05 = 592.9

Note 1: The ANOVA procedure was used for statistical analysis.

Note 2: Hybrid names starting or ending with an "X" denote a commercial experimental. Hybrids entered by the Texas Agricultural Experiment Station are either in the experimental stage or being tested as experimental check hybrids. Individuals may contact respective seed companies for the availability of planting seed for the upcoming crop year.

* Conlee Rustler and DEKALB DK-37 were entered as commercial check hybrids at our discretion. They are intended to be used for comparison purposes only.

** Grain color designated by respective seed companies: R=Red Br=Brown Bz=Bronze Rt=Red translucent W=White Wt=White translucent Ct=Cream Translucent.

*** Plant color designated by respective seed companies: T=Tan R=Red P=Purple. Those hybrids designated with an asterisk (*) indicates company did not submit plant color.

**** Maturity classification for hybrids designated by the respective seed companies: E=Early M=Medium ML=Medium Late L=Late.

***** Duncan's multiple range test was used at the .05 level.

TABLE 5.

AGRONOMIC AND TEST INFORMATION: DANEVANG

TEST:	1992 Dryland Grain Sorghum Performance Test
LOCATION:	E. E. Berndt Farm - Danevang, Texas
COOPERATORS:	E. E. Berndt, Dennis Pietsch, John Cosper, Randy Gaas, and Leon Synatschk
SOIL TYPE:	Lake Charles clay
ROW WIDTH:	40"
PREVIOUS CROP:	Cotton
LAND PREPARATION:	Shredded stalks, disked, bedded. Hipped two more times prior to planting
DATE PLANTED:	3-23-92: hand-dropped behind 8 row International planter
DATE THINNED:	4-16-92; thinned to approximately 6 plants/foot
PLOT LENGTH:	23'
FERTILIZER:	513 lb/A of 21-7-3-1.5 S-.05 Zn
HERBICIDE:	None
INSECTICIDE:	5.0 lb/A Furadan (carbofuran) at planting
RAINFALL:	Approximately 52 inches from January to harvest
IRRIGATIONS:	None
DATE HARVESTED:	7-29-92 with MF 8 plot combine
SIZE HARVESTED PLOT:	2 Rows, 23 feet long
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	70
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
TEST MEAN:	4,676 lb/A; yields corrected to 13% moisture
TEST C.V.:	12.7 percent

GENERAL INFORMATION: Good yields were achieved at this test site despite adverse conditions during the growing season. Prolonged periods of rainfall from October to planting delayed normal field operations thus delaying planting until March 23. Although seedling emergence was rapid, continued rainfall delayed cultivation and sidedressing of fertilizer until late-April. Herbicide was not applied to the test block. Weeds were controlled by hand-hoeing. Timely rainfall during the flowering stage insured grain fill as reflected in the following Table.

The test mean yield was 4,676 lb/A compared to the past 3-year average of 4,813 lb/A. Midge was observed but was not a problem.

Test Mean = 4,676 Test C. V. = 12.7 LSD .05 = 961.1

>Note 1: The ANOVA procedure was used for statistical analysis.

Note 2: Hybrid names starting or ending with an "X" denote a commercial experimental. Hybrids entered by the Texas Agricultural Experiment Station are either in the experimental stage or being tested as experimental check hybrids. Individuals may contact respective seed companies for the availability of planting seed for the upcoming crop year.

* Douglass King dk780 and George Warner W-902-W were entered as commercial check hybrids at our discretion. They are intended to be used for comparison purposes only.

** Grain color designated by respective seed companies: R=Red Br=Brown Bz=Bronze Rt=Red translucent W=White Wt=White translucent Ct=Cream Translucent.

*** Plant color designated by respective seed companies: T=Tan R=Red P=Purple. Those hybrids designated with an asterisk (*) indicates company did not submit plant color.

**** Maturity classification for hybrids designated by the respective seed companies: E=Early M=Medium ML=Medium Late L=Late.

***** Duncan's multiple range test was used at the .05 level.

TABLE 6. AGRONOMIC AND TEST INFORMATION: COLLEGE STATION

TEST:	1992 Irrigated Grain Sorghum Performance Test
LOCATION:	Texas A&M University Farm, College Station, Texas
COOPERATORS:	F. Miller, T. Dusek, D. Pietsch, R. Gaas and L.Synatschk
SOIL TYPE:	Miller clay loam
ROW WIDTH:	30"
PREVIOUS CROP:	Grain sorghum
LAND PREPARATION:	Shredded, disked, moldboarded, disked, bedded, planted
DATE PLANTED:	3-24-92, cone planter
PLOT LENGTH:	17' 8"
FERTILIZER:	80-80-0 preplant, sidedress 100-0-0 on May 7
HERBICIDE:	1 lb/A Milogard 4L (propazine) + 2.5 lb/A Ramrod 4L (propachlor) on 3-24
INSECTICIDE:	7 lb/A Furadan 15G at planting; applied .25lb/A A.I. of Lorsban for yellow sugarcane aphids; two aerial sprayings of Asana on June 16 & 19 at label rate for midge
RAINFALL:	March = 1.00", April = 4.20", May = 10.3", June = 6.40", July = 2.30", August= 0.7" Total = 24.9
IRRIGATIONS:	1 application of approximately 3" on 7-13
DATE HARVESTED:	8-10-92
SIZE HARVESTED PLOT:	2 rows 17' 8"
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	53
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
MEAN PLANT POP.:	Estimated to be between 70,000 and 90,000 plants/A
TEST MEAN:	6,000 lb/A; yields corrected to 13% moisture
TEST C.V.:	8.7 percent

GENERAL STATEMENT: Yields obtained in 1992 at the College Station test site were generally representative of those obtained by local farmers in the area. Few production problems were encountered in the growing season. The year was cooler than normal and rainfall was well distributed. Adequate soil moisture was available at planting although the seedbed was badly eroded from winter flooding. Distribution of rainfall was good from floral differentiation through black layer when no more rain was received until harvest. The trial was harvested with an experimental plot harvester. The two-row plots significantly reduced the coefficient of variation for the trial. Because of good radiation levels, good moisture conditions, and cooler than normal temperatures, yields were good on shorter than normal plants. The test mean yield of 6,000 lb/A and a C.V. of 8.7% suggests a good trial.

Disease incidence was not adequate to merit readings. Sorghum midge were observed in the test block and controlled by two aerial applications of an insecticide. Performance of the white grain, tan plant color hybrids was excellent at this location. Leaf quality was uniformly superior on the tan plant hybrids. Two hybrids in the trial had tan plant and red translucent grain which appeared well adapted.

Note 1: The ANOVA procedure was used for statistical analysis.

Table 6A. (CONTINUED)

Note 2: Hybrid names starting or ending with an "X" denote a commercial experimental. Hybrids entered by the Texas Agricultural Experiment Station are either in the experimental stage or being tested as experimental check hybrids. Individuals may contact respective seed companies for the availability of planting seed for the upcoming crop year.

1 Commercial check hybrids were not entered in the test. Hybrids that are commonly used in this area were already entered by commercial companies.

2 Grain color designated by respective seed companies: R=Red Br=Brown Bz=Bronze Rt=Red translucent W=White Wt=White translucent Ct=Cream Translucent.

3 Plant color designated by respective seed companies: T=Tan R=Red P=Purple. Those hybrids designated with an asterisk (*) indicates company did not submit plant color.

4 Maturity classification for hybrids designated by the respective seed companies: E=Early M=Medium ML=Medium Late L=Late.

5 Dr. Fred Miller, Soil and Crop Sciences Department, Texas A & M University made the following desirability ratings: 1=very good 2=good 3=average
4=poor 5=very poor.

6 Duncan's multiple range test was used at the .05 level.

TABLE 7.

AGRONOMIC AND TEST INFORMATION: THRALL

TEST:	1992 Dryland Grain Sorghum Performance Test
LOCATION:	Stiles Farm Foundation, Thrall, Texas
COOPERATORS:	Dennis Pietsch, Cloyce Coffman, Randy Gaas, Leon Synatschk, and Calvin Rinn
SOIL TYPE:	Burleson clay
ROW WIDTH:	38"
PREVIOUS CROP:	Cotton
LAND PREPARATION:	Shredded, bedded, re-bed, sprayed Bladex at label rate for winter weed control
DATE PLANTED:	5-7-92, hand dropped behind a JD7300 Max Emerge 2
DATE THINNED:	N/A
PLOT LENGTH:	25'
FERTILIZER:	120-20-0 preplant
HERBICIDE:	Treated with Atrazine + Prowl Tank Mix at label rate, when sorghum was 12" tall
INSECTICIDE:	Two aerial applications of Asana for midge control
RAINFALL:	March = 3.08", April = 1.64", May = 8.62", June = 5.29", July = 0.58", August = .67" Total = 19.88"
IRRIGATIONS:	None
DATE HARVESTED:	8-25-92 with a MF 8 plot combine
SIZE HARVESTED PLOT:	2 rows, 25 feet long
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	74
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
TEST MEAN:	3,308 lb/A; yields corrected to 13% moisture
TEST C. V.:	13.0 %

GENERAL INFORMATION: Seventy-four hybrids were entered by seventeen commercial companies and the Texas Agriculture Experiment Station at this site. This test is representative of conditions in the Southern Blacklands of Texas. As was the case in this entire region, prolonged periods of rainfall delayed normal field operations thus delaying planting. The test was planted on March 13th in an excellent seedbed prepared early. This is approximately ten days later than the optimum planting date for this area. Due to unexplainable reasons, abnormal seedling emergence resulted in very poor stands. Upon examination, it was determined that germination was very erratic within plots and between plots in each replication. Some seeds germinated and then died while other seedlings emerged but were very weak and eventually died. Plant samples were brought back to College Station but no definite determination was made for this occurrence.

On May 7th, the test was replanted using the same beds. Roundup was used after planting to kill any remaining plants from the initial planting. Approximately ten grams of seed were planted to each row. Seedling emergence was excellent and plots were not thinned. Timely rainfall in May and June resulted in rapid plant growth and development. Due to the late planting, the test block was sprayed twice for midge. Control was good but not entirely effective as reflected in the following Table.

Normally in this area, late planted sorghum does not have the same yield potential as does early planted sorghum due to lack of rainfall and high temperatures. This scenario was not true in 1992. Excellent yields were achieved despite a high plant population and a brief period of plant stress after flowering. Yields are reflected in the following Table with the test mean yield being 3,308 lb/A. Lodging was a problem in some hybrids due to charcoal rot.

Test Mean = 3,308 Test C. V. = 13.0 LSD .05 = 694.5

Note 1: The ANOVA procedure was used for statistical analysis.

Note 2: Hybrid names starting or ending with an "X" denote a commercial experimental. Hybrids entered by the Texas Agricultural Experiment Station are either in the experimental stage or being tested as experimental check hybrids. Individuals may contact respective seed companies for the availability of planting seed for the upcoming crop year.

* Douglass King dk780 and ICI Seeds Garst 5392 were entered as commercial check hybrids at our discretion. They are intended to be used for comparison purposes only.

** Grain color designated by respective seed companies: R=Red Br=Brown Bz=Bronze Rt=Red translucent W=White Wt=White translucent Ct=Cream Translucent.

*** Plant color designated by respective seed companies: T=Tan R=Red P=Purple. Those hybrids designated with an asterisk (*) indicates company did not submit plant color.

**** Maturity classification for hybrids designated by the respective seed companies: E=Early M=Medium ML=Medium Late L=Late.

***** Duncan's multiple range test was used at the .05 level.

TABLE 8.

AGRONOMIC AND TEST INFORMATION: McKINNEY

TEST:	1992 Dryland Grain Sorghum Performance Test
LOCATION:	Bailey Farms near Prosper, Texas
COOPERATORS:	Scott Bailey, Ken White, Dennis Pietsch, Randy Gaas, Leon Synatschk and Cloyce Coffman
SOIL TYPE:	Houston black clay
ROW WIDTH:	30"
PREVIOUS CROP:	Cotton
LAND PREPARATION:	Disked (2), field cultivated
DATE PLANTED:	4-3-92, by hand
PLOT LENGTH:	25'
FERTILIZER:	Broadcast 100 lb/A of Anhydrous Ammonia preplant and 100 lb/A of 10+34+0 at planting
HERBICIDE:	Banded .5 lb of Atrazine 4L at planting
INSECTICIDE:	Banded 5 lb Counter 15G in furrow at planting
RAINFALL:	Jan.=4.28", Feb.=2.83", March=4.60", April=1.58", May = 6.69"; June = 4.50"; July = 3.59"; August = .46"; Total = 28.53"
IRRIGATIONS:	None
DATE HARVESTED:	8-21-92 with a MF 8 plot combine
SIZE HARVESTED PLOT:	2 rows, 25 feet long
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	69
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
MEAN PLANT POP.:	Plants were thinned to approximately 5 plants/foot
TEST MEAN:	5,735 lb/A; yields corrected to 13% moisture
TEST C.V.:	6.4 percent

GENERAL INFORMATION: Conditions were favorable for outstanding yields to be achieved at this site and represents the potential of grain sorghum. The season started with ample moisture from fall, winter and early spring rainfall. An optimum planting date was secured. Excellent plant stands were achieved after the test block was hand-thinned to approximately 4-5 plants per foot. Timely rains during the growing season and a good fertilization program allowed for rapid growth and development and alleviated plant stress.

The test mean yield was 5,735 lb/A compared to the past 3-year average of 4,296 lb/A. Twenty-three hybrids in the test produced over 6,000 lb/A. Lodging was observed in several hybrids, but the incidence was low. Excellent bushel weights were recorded as reflected in the following Table.

Note 1: The ANOVA procedure was used for statistical analysis.

Note 2: Hybrid names starting or ending with an "X" denote a commercial experimental. Hybrids entered by the Texas Agricultural Experiment Station are either in the experimental stage or being tested as experimental check hybrids. Individuals may contact respective seed companies for the availability of planting seed for the upcoming crop year.

* East Texas ET610, ET602, ET Exp3, ET Exp1, and ET Exp2 were entered as commercial check hybrids at our discretion. They are intended to be used for comparison purposes only.

** Grain color designated by respective seed companies: R=Red Br=Brown Bz=Bronze Rt=Red translucent W=White Wt=White translucent Ct=Cream Translucent.

*** Plant color designated by respective seed companies: T=Tan R=Red P=Purple. Those hybrids designated with an asterisk (*) indicates company did not submit plant color.

**** Maturity classification for hybrids designated by the respective seed companies: E=Early M=Medium ML=Medium Late L=Late.

***** Duncan's multiple range test was used at the .05 level.

TABLE 9. AGRONOMIC AND TEST INFORMATION: LUBBOCK-LIMITED IRRIGATION

TEST:	1992 Limited Irrigated Grain Sorghum Performance Test
LOCATION:	Texas A&M University Agricultural Research and Extension Center, Lubbock, Texas
COOPERATORS:	D.T. Rosenow and C.A. Woodfin
SOIL TYPE:	Olton loam
ROW WIDTH:	40"
PREVIOUS CROP:	Cotton
LAND PREPARATION:	Disked and bedded
DATE PLANTED:	5-12-92; cone planter
DATE THINNED:	6-14-92, to 3" spacing = 52,000 plants/A
PLOT LENGTH:	16'
FERTILIZER:	200+0+0
HERBICIDE:	1.5 lb/A A.I.Milogard (propazine) pre-emerge
INSECTICIDE:	Applied 7 lb/A of Counter 20CR (terbufos) at planting. Applied .5 pt/A Lorsban for late infestation of greenbugs
RAINFALL:	May = 4.05"; June = 4.55", July = 1.66"; August = 1.49"; September = 1.13"; Total = 12.88"
IRRIGATIONS:	7-13-92 = 4"; 8-7-92 = 4"
DATE HARVESTED:	9-28-92
SIZE HARVESTED PLOT:	2 rows 16'
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	81
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
TEST MEAN:	7,447 lb/A; corrected to 13% moisture
TEST C. V.:	8.1 percent

GENERAL INFORMATION: Below normal temperatures and timely rainfall during the growing season were contributing factors resulting in above average yields. After an optimum planting date was achieved, the test block suffered a period of cool wet weather with some hail and high winds which retarded early plant growth and development. Good growing conditions soon followed resulting in excellent plant growth and panicle development. Greenbugs were observed late in the season, contributing to a few "hot spots" of lodged plants. Bird damage was very light. Silver and red tape was used for bird control and worked very well. The large acreage of sorghum in the area also reduced bird damage. Stands were excellent and there was no disease problems. Dry warm weather after September 1 resulted in some moderate moisture stress causing premature plant death and lodging in a few entries. A leaf and plant death rating is shown in Table 9A.

Test Mean = 7447 Test C. V. = 8.1 LSD .05 = 972.3

Note 1: The ANOVA procedure was used for statistical analysis.

Note 2: Hybrid names starting or ending with an "X" denote a commercial experimental. Hybrids entered by the Texas Agricultural Experiment Station are either in the experimental stage or being tested as experimental check hybrids. Individuals may contact respective seed companies for the availability of planting seed for the upcoming crop year.

Table 9A. (CONTINUED)

1 NC+ Hybrids NC+ 271 and DeKalb DK-41Y were entered as commercial check hybrids at our discretion. They are intended to be used for comparison purposes only.

2 Grain color designated by respective seed companies: R=Red Br=Brown Bz=Bronze Rt=Red translucent W=White Wt=White translucent Ct=Cream Translucent.0

3 Plant color designated by respective seed companies: T=Tan R=Red P=Purple. Those hybrids designated with an asterisk (*) indicates company did not submit plant color.

4 Maturity classification for hybrids designated by the respective seed companies: E=Early M=Medium ML=Medium Late L=Late.

5 LEAF AND PLANT DEATH RATING: 1=no leaf and plant death 5=leaves and stem completely dead.

6 Duncan's multiple range test was used at the .05 level.

TABLE 10. AGRONOMIC AND TEST INFORMATION: LUBBOCK-DRYLAND

TEST:	1992 Dryland Grain Sorghum Performance Test
LOCATION:	Texas A&M University Agricultural Research and Extension Center, Lubbock, Texas
COOPERATORS:	G.C. Peterson and J.W. Jones
SOIL TYPE:	Amarillo fine sandy loam
ROW WIDTH:	40"
PREVIOUS CROP:	Sorghum
LAND PREPARATION:	Shredded sorghum stalks from previous year, disc-bedded on top of old beds
DATE PLANTED:	6-23-92; cone planter
DATE THINNED:	7-14-92
PLOT LENGTH:	16'
FERTILIZER:	Applied 40+0+0 per acre before planting
HERBICIDE:	Applied 1.6 lb/A Milogard (propazine) preplant and 1.75 pt/A Dual at layby.
INSECTICIDE:	Applied 7.0 lb/A Counter 15G (terbufos) at planting and 0.9 pt/A Asana and .5 pt/A Lorsban applied 8-22-92 for midge and greenbug control.
RAINFALL:	May = 4.05"; June = 4.55"; July = 1.66"; August = 1.49"; September = 1.13"; October=0.00" Total = 12.88"
IRRIGATIONS:	None
DATE HARVESTED:	10-29-92
SIZE HARVESTED PLOT:	1/1000 acre
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	91
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
MEAN PLANT POP.:	26,000 plants/A

GENERAL INFORMATION: This was a good dryland test with excellent plant stands. Above average rainfall filled the subsoil profile and allowed for quick seed emergence. Warm dry conditions after September 1 contributed to significant moisture stress during the grain filling stage. This resulted in considerable premature leaf and plant death and associated lodging in certain hybrids. Asana and Lorsban were applied for midge and greenbug control with excellent results. The plots had no disease, bird or midge damage.

Land preparation consisted of shredding sorghum stalks from the previous year, running sweeps between rows for weed control, and disc bedding on top of old beds. This was the tenth consecutive year that the same beds have been used in this manner. Furrow dikes are maintained in every row essentially year round, with dikes re-established in every row following planting.

Plots were hand harvested and threshed with a plot thresher. Lodged plants were harvested and used in yield determination.

Test Mean = 3,534	Test C. V. = 14.6	LSD .05 = 831.8												

Note 1: The ANOVA procedure was used for statistical analysis.

Note 2: Hybrid names starting or ending with an "X" denote a commercial experimental. Hybrids entered by the Texas Agricultural Experiment Station are either in the experimental stage or being tested as experimental check hybrids. Individuals may contact respective seed companies for the availability of planting seed for the upcoming crop year.

1 NC+ Hybrids NC+ 271 and DeKalb DK-41Y were entered as commercial check hybrids at our discretion. They are intended to be used for comparison purposes only.

2 Grain color designated by respective seed companies: R=Red Br=Brown Bz=Bronze Rt=Red translucent W=White Wt=White translucent Ct=Cream Translucent.

3 Plant color designated by respective seed companies: T=Tan R=Red P=Purple. Those hybrids designated with an asterisk (*) indicates company did not submit plant color.

4 Maturity classification for hybrids designated by the respective seed companies: E=Early M=Medium ML=Medium Late L=Late.

5 LEAF AND PLANT DEATH RATING: 1=no leaf and plant death 5=leaves and stem completely dead.

6 Duncan's multiple range test was used at the .05 level.

TABLE 11.

AGRONOMIC AND TEST INFORMATION: DUMAS

TEST:	1992 Irrigated Grain Sorghum Performance Test
LOCATION:	Tri-C Farms, Dumas, Texas
COOPERATORS:	Joe Cox, Buddy Cox, Mike Cox, Dennis Pietsch, Randy Gaas, Leon Synatschk, and Robert Harris
SOIL TYPE:	Sherman silty clay loam
ROW WIDTH:	30"
PREVIOUS CROP:	Wheat
LAND PREPARATION:	disked, sweep, chiseled, and bedded
DATE PLANTED:	5-20-92, by hand
DATE THINNED:	6-24-92; thinned to approximately 90,000 plants/acre
PLOT LENGTH:	25'
FERTILIZER:	Applied 250 lb/A of Anhydrous Ammonia pre-plant and 100 lb/A of 11-52-0 + 4lb/A Zinc pre-plant
HERBICIDE:	Applied 1.25 lb/A of AAtrex 90 (atrazine)
INSECTICIDE:	8-19-92: Applied 1 pt/A Lorsban for greenbug control
IRRIGATIONS:	Pre-plant and 3 irrigations of approximately 4"/irrigation
DATE HARVESTED:	10-21-92 with a MF8 plot combine
SIZE HARVESTED PLOT:	2 rows-25' long
TEST DESIGN:	Randomized block
NUMBER ENTRIES:	80
NUMBER REPLICATIONS:	3
NUMBER ROWS/PLOT:	2
TEST MEAN:	9,595 lb/A; yields corrected to 13% moisture
TEST C. V.:	6.9 percent

GENERAL INFORMATION: Near-perfect conditions throughout the growing season resulted in outstanding yields at this site. An excellent seedbed was available for the May 20 planting date which is considered to be optimum for this area. Seedling emergence was rapid and excellent stands were attained. Excellent plant growth resulted from above normal rainfall and a timely irrigation schedule throughout the growing season.

The test mean yield was 9,595 lb/A compared to the past three year average of 7,746 lb/A. It is interesting to note that 26 hybrids in the test produced over 10,000 lb/A. Test weights were incredible with the range being from 58.9 lb/bu to 64.8 lb/bu as reflected in the following Table. This was a very uniform test as indicated by the low coefficient of variation (6.9%). The test was harvested with a MF 8 plot combine equipped with electronic equipment that measured plot weight, moisture, and test weight. A freeze was recorded at the test site approximately two weeks prior to harvest, thus moisture content at harvest was virtually the same for all hybrids.

Bird damage was observed, particularly in the earlier maturing hybrids, but damage was minimal. Greenbugs were also observed but controlled by applying the insecticide Lorsban.

Appreciation is expressed to Norman Wuthrich, Research Associate, Texas A&M University Research and Extension Center, Halfway, Texas for recording flowering notes at the appropriate time.

SUPPLEMENT

This section contains results from supplementary grain sorghum tests conducted at Runnels County, and Halfway, Texas. Although these tests are not official performance test sites evaluated under Project 1418, results may be used as necessary to determine the adaptability in these areas.

Table S1. Gary Jacob's Grain Sorghum Variety Test (Runnels County, 1992).

OBJECTIVES

Variety tests provide producers with the opportunity of comparing new varieties of grain sorghum with varieties that have been successfully grown under varying weather conditions in Runnels County. Utilization of new varieties, that are equal to or exceed currently available varieties, should increase production and income of county producers.

MATERIALS AND METHODS USED

This was a strip plot with a check variety (Warner 632W) planted between every second or third variety. Variation between checks was used to adjust the yields to reduce impact made by variety location. Plots were harvested by a combine using a weigh-wagon. Moisture was taken from each variety harvested and used to adjust the yield to a standard 14% moisture.

AGRONOMIC AND TEST INFORMATION

TEST:	1992 Dryland Grain Sorghum Performance Test
LOCATION:	3 miles west of Winters, Texas
COOPERATORS:	Gary Jacob (Producer) Mike Mauldin (County Extension Agent) Rick Minzenmayer (Extension Agent-Entomology Runnels & Tom Green Counties) Dr. Billy Warrick (Extension Agronomist:San Angelo)
SOIL TYPE:	Portales clay loam
ROW WIDTH:	40"
PREVIOUS CROP:	Cotton
DATE PLANTED:	April 24, 1992 with an 8-row John Deere 804 planter
PLANTING RATE:	Approximately 4 pounds per acre
FERTILIZER:	30-10-0
HERBICIDES:	None
MOISTURE @ PLANTING	Good underground moisture

SUMMARY

Twenty-eight grain sorghum varieties were planted by Gary Jacob in northern Runnels County, three miles west of Winters, Texas on farm road 153. Normal dryland production practices were used. Yields were reduced in some varieties due to midge damage. When reviewing the test results, producers should keep in mind that this is only one years data. Year to year consistency should be a primary consideration on selecting varieties of grain sorghum to be planted.

ECONOMIC ANALYSIS

There is a 309 percent difference between the yield of the lowest and highest varieties in the test. Using a price of \$3.40 per cwt. for grain sorghum, this results in a difference of \$99.56 per acre. The higher yield and income of the best varieties in this test justifies the adoption of these into certain farm production.

ACKNOWLEDGMENTS

Sincere appreciation is expressed to Gary Jacob for establishing and managing the dryland grain sorghum variety test. Also, a word of thanks to all those that assisted with the county grain sorghum tour and to those that assisted in harvesting the plots. A special thanks to all the seed companies that donated seed for the test plot.

TABLE S3.

AGRONOMIC AND TEST INFORMATION: HALFWAY, TEXAS
Supplementary Grain Sorghum Test

TITLE:	Single row irrigated grain sorghum performance test at the Texas Agricultural Experiment Station, Halfway, Texas, 1992
AUTHORS:	N.E. Wuthrich, C. A. Woodfin, J. W. Jones, D. T. Rosenow, G. C. Peterson, Research Associate, Senior Research Associate, Research Associate, Professor and Associate Professor
METHODS & MATERIALS:	<p>Experimental Design: Triple lattice</p> <p>Plot Size: 6.66 ft(2 beds x 21 ft)</p> <p>Plot Spacing: Single row on 40-inch spaced beds</p> <p>Soil Type: Pullman clay loam</p> <p>Previous Crop: Corn</p> <p>Fertilizer: 170-55-0-4.5 liquid (N-P-K-S)</p> <p>Herbicide: 1 lb ai/A Atrazine, 1.5 lbs ai/A Dual</p> <p>Insecticide: 9.5 lbs/A Counter 20CR preplant</p> <p>Irrigations: 2.85, 2.26, 2.63, 2.25, and 2.04 in/A applied on July 21, Aug 3, 17, 28 and Sep 15</p> <p>Rainfall: Jan-Oct (27.59")</p> <p>Planting Date: June 5</p> <p>Seeding Rate: 82,887 seeds/A</p> <p>Plant Population: See Table S2</p> <p>Harvest Date: October 26</p>

**RESULTS &
DISCUSSION:**

Table S4 contains all agronomic data recorded in 1992.

Yields were excellent in this test, with a record mean of 10,090 lb/A. Near perfect weather conditions were conducive for plant growth and grain production.

Beneficial rainfall prior to planting and during the early part of the growing season provided adequate moisture without irrigation.

The systemic insecticide, Counter 20CR, was applied preplant for greenbug control. No insecticide was needed after emergence.

No crop loss was noted.

Three replications with 2-row plots were combine harvested. Grain yields were adjusted to 13% moisture and converted to pounds per acre.

Test Mean = 10089 Test C. V. = 5.5 LSD .05 = 893.8

Note : The ANOVA procedure was used for statistical analysis.

1 All yields adjusted to 13% moisture.

2 Any two hybrids having a common letter are not significantly different at the 0.05 probability level.

3 Number of days from planting until date when majority of heads are in half-bloom.

Table S4. (CONTINUED)

4 Head exertion is average number of inches from flag leaf to the base of the head.

5 Height uniformity rating: 1 = uniform 5 = irregular.

6 Head type rating 1-5: 1 = tight, compact head 5 = loose, open head.

7 Seed company maturity designation: ME = medium early, M = medium, ML = medium late, L = late.

TABLE S5.

AGRONOMIC AND TEST INFORMATION: LAMESA, TEXAS
Supplementary Grain Sorghum Test

TITLE:	Dryland grain sorghum performance test at Lamesa AG-CARES, Lamesa, Texas, 1992.
AUTHORS:	D. T. Rosenow and C. A. Woodfin, Professor and Research Associate
METHODS & MATERIALS:	<p>Experimental Design: Randomized block with 3 replications</p> <p>Plot Size: 6.66 ft (2 beds x 17 ft)</p> <p>Plot Spacing: Single row on 40-inch spaced beds</p> <p>Soil Type: Amarillo fine sandy loam</p> <p>Previous Crop: Dryland cotton</p> <p>Fertilizer: 42-0-0 preplant in April</p> <p>Herbicide: 1.5 lb ai/a Dual on July 24</p> <p>Insecticide: 1.25 pt/A Lannate on September 16 for midge and headworms</p> <p>Planting Date: July 10</p> <p>Seeding Rate: 30,000 seed /A and hand thinned to uniform stand of approximately 26,000 plants per acre</p> <p>Harvest Date: November 10</p>

**RESULTS &
DISCUSSION:**

Table 1 contains all data recorded in 1992. Grain yields were excellent with a top yield of 7,393 lb/A, and a test mean yield of 4,223 lb/A. The test was originally planted on June 25 in the dryland southwest corner of AG-CARES. However, very poor stands were obtained due to Treflan damage. Treflan had been applied prior to bedding in late 1991 in anticipation of planting cotton in 1992. The test was then replanted on July 10, and by planting deeper in the bed, generally adequate stands were obtained. The test plots were hand harvested (1/2000 A=6.6 ft) and threshed with a plot combine.

Above normal rainfall and cooler than normal temperatures contributed to excellent plant growth and development and high yield expression. A warm, dry fall was favorable for this late planting date. Some hybrids were not mature at the first killing freeze on November 4, and these hybrids still had somewhat higher grain moisture at harvest. Hybrids that flowered in about 70 or more days would normally be considered too late-maturing for a July 10 planting in the Lamesa area. Also, the above normal rainfall tended to be beneficial to later maturing hybrids, which would often not be the case in a more normal rainfall year. Some midge developed in the test block which warranted one spraying of an insecticide. Some control was achieved, but damage still occurred in some hybrids. Midge damage ratings were taken, and the resistance in experimental midge resistant hybrids was very evident. Grain yields were not adjusted for midge damage. Also, in some of the very late flowering hybrids, some cool temperature induced sterility was present, and was difficult to separate from midge damage. There was no bird or disease damage. Greenbugs were observed in the test block, but populations were low and controlled by parasites.

All seed company entries, except those beginning or ending with an X, are commercially available. Most TAES hybrids are experimental and not commercially available.

Table S6. Grain yield and other agronomic data for one hundred and four grain sorghum hybrids grown under dryland conditions at Lamesa AG CARES, Lamesa, Texas, 1992.

Mean Yield=4,223 lb/A

CV=21.2%

LSD=1,500lb/A

- 1 All yields adjusted to 13% moisture.
- 2 Any two hybrids having a common letter are not significantly different at the 0.05 probability level.
- 3 Number of days from planting until date when one-half of the heads have started to flower.
- 4 Head exertion is the average number of inches from the flag leaf to the base of the head.
- 5 Average percent of midge damage estimated by C. A. Woodfin on November 2.
- 6 Average midge damage rating by G. C. Peterson on November 10, where 1=0-10%, 2=10-20%, 3=21-30%, 4=31-40%, 5=41-50%, to 9=81-100%.
- 7 Average estimated percent stand in the harvested area.
