2016 South Central Texas Regional Water Plan

Volume I — Executive Summary and Regional Water Plan

Prepared by:

South Central Texas Regional Water Planning Group

With administration by:

San Antonio River Authority

With technical assistance by:

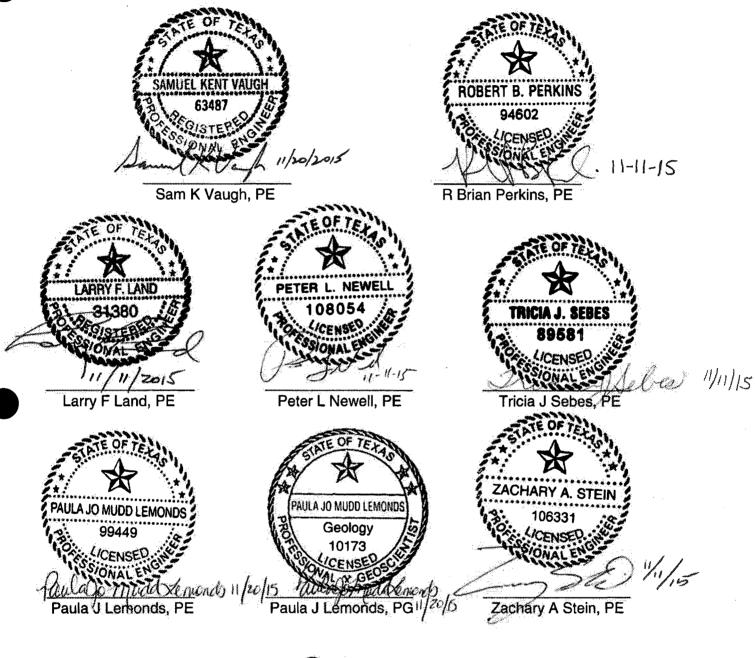

HDR Engineering, Inc. Ximenes and Associates 2015 DEC - 1 PH 2: 38

December 2015

South Central Texas Regional Water Planning Group Members

Name	Interest	Membership	Affiliation
Con Mims	River Authorities	Chair, Ex. Comm.	Nueces RA
Tim Andruss	Water Districts	Vice Chair, Ex. Comm.	Victoria County GCD
Gary Middleton	Municipalities	Secretary, Ex. Comm.	City of Victoria
Donna Balin	Environmental	At-Large Ex. Comm.	
Kevin Janak	Electric Generation	At-Large Ex. Comm.	Coleto Creek Power
Gene Camargo	Water Utilities	Member	McCoy WSC
Rey Chavez	Industries	Member	San Antonio Manufacturers Assoc.
Alan Cockerell	Agriculture	Member	
Will Conley	Counties	Member	Hays County Commissioner
Don Dietzmann	GMA Representative	Member	GMA 9
Art Dohmann	GMA Representative	Member	GMA 15
Blair Fitzsimons	Agriculture	Member	
Vic Hilderbran	GMA Representative	Member	GMA 7
John Kight	Counties	Member	Kendall County Commissioner
Russell Labus	Water Districts	Member	Evergreen UWCD
Glenn Lord	Industries	Member	Dow Chemical
Doug McGookey	Small Business	Member	Geologist
Dan Meyer	GMA Representative	Member	GMA 10
Iliana Peña	Environmental	Member	Mitchell Lake Audubon Center
Robert Puente	Municipalities	Member	San Antonio Water System
Steve Ramsey	Water Utilities	Member	New Braunfels Utilities
David Roberts	Small Business	Member	
Roland Ruiz	Water Districts	Member	Edwards Aquifer Authority
Diane Savage	GMA Representative	Member	GMA 13
Suzanne Scott	River Authorities	Member	San Antonio River Authority
Greg Senglemann	Water Districts	Member	Gonzales County UWCD
Thomas Taggart	Municipalities	Member	San Marcos
Dianne Wassenich	Public	Member	
Bill West	River Authorities	Member	Guadalupe-Blanco River Authority
Adam Yablonski	Agriculture	Member	Rancher

2016 South Central Texas Regional Water Plan

Grady Reed

Laura Sampson

his report is released by: HDR Engineering, Inc. 8404 Indian Hills Dr. Omaha, NE 68114 Registration No. F-754.

Table of Contents

ES	Execu	utive Summary	ES-1			
1	Desci	Description of the South Central Texas Region [31 TAC §357.30]				
	1.1	Background	1-1			
	1.2	Physical Description of the South Central Texas Region	1-2			
		1.2.1 Climate				
		1.2.2 General Geology	1-4			
		1.2.3 Vegetational Areas				
		1.2.4 Natural Resources				
		1.2.5 Major Water Demand Centers				
	1.3	Population and Demography				
		1.3.1 Historical and Recent Trends in Population				
		1.3.2 Demographic Characteristics				
	1.4	Economy — Major Sectors and Industries				
		1.4.1 Summary of the South Central Texas Regional Economy				
		1.4.2 Agricultural Production1.4.3 Livestock Production				
		1.4.4 Mining				
		1.4.5 Manufacturing				
		1.4.6 Trades and Services				
	1.5	Water Uses	1-20			
	1.6	Wholesale Water Providers	1-21			
		1.6.1 San Antonio Water System				
		1.6.2 Guadalupe-Blanco River Authority				
		1.6.3 Canyon Regional Water Authority				
		1.6.4 Schertz-Seguin Local Government Corporation				
		1.6.5 Springs Hill WSC				
		1.6.6 Texas Water Alliance				
		1.6.7 Hays-Caldwell Public Utility Agency1.6.8 Cibolo Valley Local Government Corporation				
	1.7	-				
	1.7	Water Resources and Quality Considerations				
		1.7.1 Groundwater 1.7.2 Surface Water				
		1.7.3 Major Springs				
		1.7.4 Surface Water Quality				
	1.8	Threats to Agricultural and Natural Resources				
	1.9	Summary of Existing Plans				
	1.0	1.9.1 2012 State Water Plan				
		1.9.2 2011 Regional Water Plan				
		1.9.3 Local Water Plans				
		1.9.4 Current Preparations for Drought	1-34			
	1.10	Water Loss Audits	1-36			
	1.11	Drought of Record	1-40			
2	Ponu	Ilation and Water Demand Projections [31 TAC §357.31]				
_	2.1					
	2.2	Municipal Water Demand Projections				
	2.2	Industrial Water Demand Projections

2016 South Central Texas Regional Water Plan Executive Summary

ES.1 Background

Since 1957, the Texas Water Development Board (TWDB) has been charged with preparing a comprehensive and flexible long-term plan for the development, conservation, and management of the state's water resources. The current state water plan, Water for Texas, January 2012, was produced by the TWDB and based on approved regional water plans pursuant to requirements of Senate Bill 1 (SB1), enacted in 1997 by the 75th Texas Legislature. As stated in SB1, the purpose of the regional water planning effort is to:

"Provide for the orderly development, management, and conservation of water resources and preparation for and response to drought conditions in order that sufficient water will be available at a reasonable cost to ensure public health, safety, and welfare; further economic development; and protect the agricultural and natural resources of that particular region."

SB1 also provides that future regulatory and financing decisions of the Texas Commission on Environmental Quality (TCEQ) and the TWDB, respectively, be consistent with approved regional plans.

The TWDB divided the state into 16 planning regions and appointed members to the regional planning groups. As shown in Figure ES-1, the South Central Texas Region (Region L) includes all of 20 counties as well as the portion of Hays County located in the Guadalupe River Basin. The South Central Texas Regional Water Planning Group (SCTRWPG) has a total of 30 voting members. These members represent 12 stakeholder groups (Public, Counties, Municipalities, Industry, Agriculture, Environmental, Small Business, Electric Generating Utilities, River Authorities, Water Districts, Water Utilities, and Groundwater Management Areas), serve without pay, and are responsible for the development of the South Central Texas Regional Water Plan.

The SCTRWPG adopted bylaws to govern its operations and, in accordance with its bylaws, selected the San Antonio River Authority (SARA) to serve as its administrative agency (Qualified Political Subdivision) to: (1) Develop scopes of work; (2) Apply for TWDB planning grants; (3) Contract with the TWDB for the grants; and (4) Manage the development of the Regional Water Plan, including supervision of technical and public participation consultants. Members of the SCTRWPG and key staff of several participants serve as an ad hoc Staff Workgroup to review and guide SARA and consultants' work.

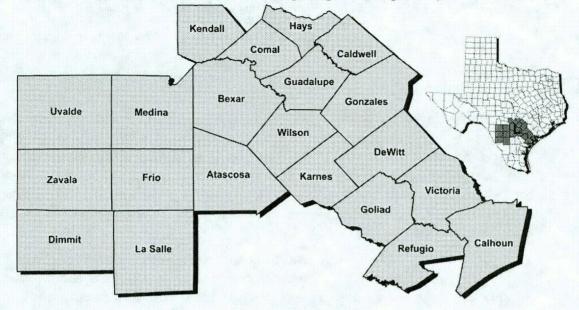

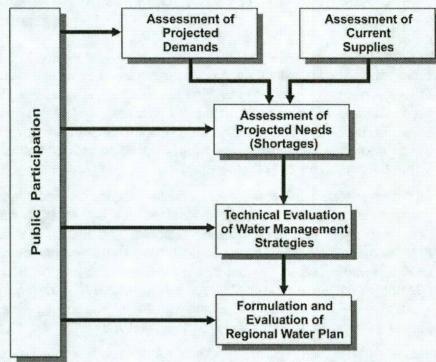

Figure ES-1 South Central Texas Planning Region (Region L)

Pursuant to Regional and State Water Planning Guidelines (Texas Administrative Code, Title 31, Part 10, Chapters 357 and 358), the SCTRWPG developed the 2001, 2006, and 2011 South Central Texas Regional Water Plans, which were then integrated into Water for Texas – 2002, 2007, and 2012, respectively, by the TWDB. The 2016 South Central Texas Regional Water Plan, of which this Executive Summary is a part, represents the fourth update of a regional water plan as presently required to occur on a five-year cycle. The TWDB will integrate this Regional Water Plan into a State Water Plan to be issued in 2017. The planning process for the South Central Texas Region is summarized in Figure ES-2.

Figure ES-2 Regional Planning Process

ES.2 Description of South Central Texas Region

The South Central Texas Region includes counties that are located in whole or in part in the Rio Grande, Nueces, San Antonio, Guadalupe, Lavaca, and Colorado River Basins and the San Antonio-Nueces, Lavaca-Guadalupe, and Colorado-Lavaca Coastal Basins. Major urban population centers include the cities of San Antonio, Victoria, Seguin, New Braunfels, and San Marcos which are located within Bexar, Victoria, Guadalupe, Comal, and Hays Counties, respectively. The regional economy is dominated by the trades & services and manufacturing sectors with much smaller, but significant, contributions from the agricultural and mining sectors. Physical terrain of the region ranges from the Hill Country of the Edwards Plateau to the Coastal Plains. Vegetational areas include the Edwards Plateau, South Texas Plains, Blackland Prairies, Post Oak Savannah, and Gulf Prairies and Marshes. Many species occur within the region that are listed by the U.S. Fish & Wildlife Service (USFWS) or Texas Parks & Wildlife Department (TPWD) as rare, threatened, or endangered. Several of the species listed as endangered occur in or near Comal and San Marcos Springs, the two largest springs in Texas. Average annual precipitation ranges from less than 22 inches in Dimmit County up to 40 inches in Calhoun County.

ES.3 Population, Water Demands, Existing Supplies, and Needs

In order to develop water plans to meet future water needs, it is necessary to make projections of future water demands for the region. Integrating information from the 2010 Census and reported water uses from the around the state, the TWDB provided draft population and water demand projections for cities, rural areas, and water user groups within each of the 21 counties of the region. The population of the South Central Texas Region is estimated to be about 3.0 million in 2020 and projected to grow to about 5.2 million by 2070 (Table ES-1).

Municipal water is fresh water used for drinking, sanitation, and other purposes in homes and commercial establishments of both cities and rural areas. A summary of municipal population, water demands, existing supplies, and needs is shown in Table ES-1. Please note that municipal is presented in two parts: Municipal and County-Other. Total municipal water use in the South Central Texas Region in 2020 is expected to be 469,065 acft/yr, increasing to 754,306 acft/yr by 2070. Existing supplies range from 473,600 acft/yr in 2020 to 481,109 acft/yr in 2070. Municipal needs are projected to be 72,636 acft/yr in 2020, increasing to 304,164 acft/yr by 2070.

Industrial (Manufacturing) water is fresh water used in the manufacture of industrial products. All industries in the region are projected to use 123,983 acft/yr of water in 2020 and 178,820 acft/yr in 2070. Existing supplies for industries range from 141,548 acft/yr in 2020 to 141,660 acft/yr by 2070. The projected needs for industrial use are 6,308 acft/yr in 2020, increasing to 40,034 acft/yr by 2070. A regional summary of industrial water demands, existing supplies, and needs is shown in Table ES-1.

In the South Central Texas Region, the principal uses of water for mining are for the extraction of stone, clay, and petroleum (including fracking) and for sand and gravel washing. Mining demands in the region are projected to be 48,738 acft/yr of water in 2020 and 41,209 acft/yr in 2070. Existing supplies for mining range from 37,919 acft/yr in 2020 to 40,692 acft/yr by 2070. The projected needs for mining use are 10,822 acft/yr in 2020, decreasing to 666 acft/yr by 2070. A regional summary of mining water demands, existing supplies, and needs is shown in Table ES-1.

Eight counties (Atascosa, Bexar, Calhoun, Frio, Goliad, Guadalupe, Hays, and Victoria) of the region use cooling and boiler feed water in steam-electric power production. Steam-Electric generation in the region is projected to use 59,901 acft/yr of water in 2020 and 152,702 acft/yr in 2070. The existing supply for steam-electric generation is 105,262 acft/yr for all decades. The projected needs for steam-electric generation are 4,506 acft/yr in 2020, increasing to 70,696 acft/yr by 2070. A regional summary of steam-electric water demands, existing supplies, and needs is shown in Table ES-1.

Livestock water is fresh water used in the raising of cattle, chickens, and other animals. Cumulative livestock demand in the region is projected to be 24,038 acft/yr in all decades. Existing supply for livestock is also projected to be 24,038 acft/yr in all decades. Therefore, there are no needs associated with livestock in the 2016 SCTRWP. A regional summary of livestock water demands, existing supplies, and needs is shown in Table ES-1.

*WUG supplies and projected demands are entered for each of a WUG's region-county-basin divisions. The needs shown in the WUG Category Summary report are calculated by first deducting the WUG split's projected demand from its total existing water supply volume. If the WUG split has a greater existing supply volume than projected demand in any given decade, this amount is considered a surplus volume. Before aggregating the difference between supplies and demands to the WUG category level, calculated surpluses are updated to zero so that only the WUGs with needs in the decade are included with the Needs totals.

The TWDB irrigation water use data show annual use for irrigation to grow cotton, grain, vegetables, and tree crops in the South Central Texas. Irrigation water use for the region is projected to be 344,629 acft/yr of water in 2020, decreasing to 282,760 acft/yr by 2070. Existing supplies for irrigation are 245,522 acft/yr in 2020 and 222,971 acft/yr in 2070. The projected needs for irrigation are 105,799 acft/yr in 2020, decreasing to 67,383 acft/yr by 2070. A regional summary of irrigation water demands, existing supplies, and needs is shown in Table ES-1.

Total projected water demand for the South Central Texas Region is the sum of water demand projections for municipal, industrial, steam-electric power generation, mining, irrigation, and livestock uses. Projected water demands are expected to grow by 363,481 acft/yr (34 percent) during the 50-year planning horizon (2020-2070), while existing supply is expected to decrease by 12,157 acft/yr (1 percent) over the same time period. Water needs are expected to more than double from 200,071 acft/yr in 2020 to 482,943 acft/yr in 2070. Table ES-2 summarizes the second-tier identified water needs by use type.

	2020	2030	2040	2050	2060	2070

Table ES- 2 Second-Tier Identified Water Needs Summary

In accordance with TWDB guidelines, the SCTRWPG identified nine Wholesale Water Providers that supply or plan to supply water in the South Central Texas Region. These providers are listed in Table ES-3, along with a general description of their service areas. TWDB guidance defines a Wholesale Water Provider as a provider such as a river authority, water supply corporation, or city that has, or is expected to have, contracts to sell more than 1,000 acft wholesale in a year. The SCTRWPG has worked with each of the Wholesale Water Providers in an effort to quantify their projected demands, which typically include the demands of several cities, utilities, and other water user groups.

Wholesale Water Provider	Primary Service Areas
San Antonio Water System (SAWS)	Bexar County
Canyon Regional Water Authority (CRWA)	Bexar, Caldwell, Comal, Guadalupe, Hays, and Wilson Counties
Cibolo Valley Local Government Corporation (CVLGC)	Bexar, Comal, and Guadalupe Counties
Guadalupe-Blanco River Authority (GBRA)	Kendall, Comal, Hays, Caldwell, Guadalupe, Gonzales, DeWitt, Victoria, Refugio, and Calhoun Counties
Hays/Caldwell Public Utility Agency (HCPUA)	Caldwell, Comal, Guadalupe, and Hays Counties
Lavaca-Navidad River Authority (LNRA)	Calhoun County
Schertz-Seguin Local Government Corporation (SSLGC)	Schertz, Seguin, Selma, Universal City, Garden Ridge, and Springs Hill WSC
Springs Hill WSC	Springs Hills WSC, La Vernia, Crystal Clear WSC, and East Central WSC
Texas Water Alliance	Gonzales, Guadalupe, Comal, Hays, and Caldwell Counties

Table ES-3 Wholesale Water Providers and Service Areas

A second-tier needs analysis will be performed to identify water needs by WUG/WWP after implementation of conservation and direct reuse strategies. Such analysis will be presented in a Second-Tier Identified Water Needs table when it becomes available from TWDB.

ES.4 Water Supply Sources

There are five major and three minor aquifers supplying water to the region. The five major aquifers are the Edwards (Balcones Fault Zone), Carrizo-Wilcox¹, Trinity, Gulf Coast, and Edwards-Trinity (Plateau) Aquifers. The three minor aquifers are the Sparta, Queen City, and Yegua-Jackson Aquifers. The Region is located in parts of the Rio Grande, Nueces, San Antonio, Guadalupe, Colorado, and Lavaca River Basins and parts of the Colorado-Lavaca, Lavaca-Guadalupe, and San Antonio-Nueces Coastal Basins. The existing surface water supplies of the region include storage reservoirs and run-of-river water rights.

Groundwater supplies in the region are limited to the Modeled Available Groundwater (MAG) estimates based on Desired Future Conditions (DFC) established by Groundwater Management Area (GMA) pursuant to House Bill 1763 of the 79th Texas Legislature as well as the permitting authority of groundwater conservation districts. In the case of the Edwards Aquifer, the Edwards Aquifer Habitat Conservation Plan (EAHCP) has established the Initial Regular Permit (IRP), critical period management

¹ Although traditionally identified by the as one major aquifer, the Carrizo and Wilcox formations are generally separated by an aquitard which serves to limit or preclude hydrologic connectivity between the two formations in some portions of the planning region.

restrictions, and water supply components necessary to maintain minimum springflows at Comal and San Marcos Springs.

Development of surface water resources has been limited in the South Central Texas Region because of the presence of significant quantities of groundwater. The largest runof-river water rights are concentrated below the confluence of the Guadalupe and San Antonio Rivers and are held by the Guadalupe-Blanco River Authority and Dow Chemical Company. These diversion rights total about 175,500 acft/yr. Significant water rights associated with existing reservoirs are held by the Guadalupe-Blanco River Authority (Canyon Reservoir), Bexar-Medina-Atascosa Counties WCID #1 (Medina Lake System), CPS Energy (Calaveras and Braunig Lakes), and Coleto Creek Power (Coleto Creek Reservoir). Authorizations for consumptive use associated with these reservoirs total about 230,000 acft/yr.

ES.5 Social and Economic Impacts of Not Meeting Projected Water Needs

The SCTRWPG identified 79 individual water user groups that showed shortages or needs during drought-of-record supply conditions during the 2020 to 2070 planning period. Of the 21 counties in the South Central Texas Region, 19 have water user groups with projected water needs (shortages). A TWDB report presenting the socio-economic impacts of not meeting needs is included as Appendix F. In summary, Region L could experience \$1.99 billion in income losses and almost 18,300 job losses in 2020 if no water management strategies are implemented to meet projected shortages. Similarly, Region L could experience \$5.91 billion in income losses and about 50,100 job losses in 2070 if no water management strategies are implemented to meet projected shortages.

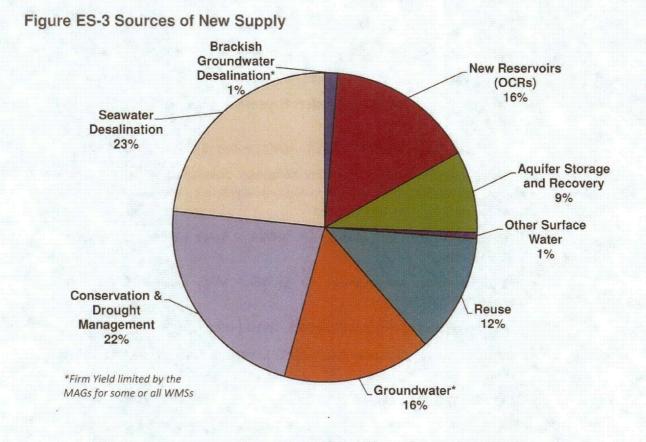

ES.6 Water Management Strategies to Meet Projected Water Needs

The regional water planning process includes making projections of the water needs of each water user group, identification of potentially feasible water management strategies (WMS) through public input, and evaluation of such strategies in accordance with TWDB rules. Technical evaluation of water management strategies includes calculation of potential quantity of water available during drought conditions, reliability of supplies, cost of water delivered to the water users' distribution systems in a form ready to be distributed for end use, environmental and implementation issues, effects upon other water resources of the state, threats to agricultural and natural resources, consistency comparisons among strategies, recreational effects, third party social and economic impacts of voluntary transfers, efficient use of existing supplies, and water quality considerations.

ES.7 South Central Texas Regional Water Plan

The South Central Texas Regional Water Plan includes recommended water management strategies that emphasize water conservation, reuse, aquifer storage and

recovery, groundwater desalination, seawater desalination, new off-channel reservoirs, new groundwater, and new surface water supplies. Water management strategies recommended to meet projected needs in the South Central Texas Region could produce new supplies in excess of 787,000 acft/yr in 2070 and may be categorized by source as shown in Figure ES-3.

Water management strategies emphasizing **conservation**, including drought management, comprise about 175,707 acft/yr (22 percent) of recommended new supplies at an estimated unit cost of \$684/acft/yr².

The 2016 SCTRWP includes the **reuse** in the form of the Direct Recycled Water Programs water management strategy at 97,763 acft/yr which could represent approximately 12 percent of the recommended new supplies.

Water management strategies that simultaneously develop **fresh groundwater** supplies and limit depletion of storage in regional aquifers comprise about 16 percent of recommended new supplies and include:

- Local Groundwater Supplies (Carrizo-Wilcox, Gulf Coast, Leona Gravels, Yegua-Jackson, and Trinity) (7,837 acft/yr @ \$130/acft/yr - \$5,316/acft/yr);
- Hays/Caldwell PUA Project (21,833 acft/yr @ \$1,926/acft/yr);

² \$684/acft/yr is an average cost of municipal water conservation. Actual unit costs vary from WUG to WUG and from decade to decade.

- TWA Regional Carrizo MAG Limited (15,000 acft/yr @ \$2,490/acft/yr);
- TWA Trinity Project (5,000 acft/yr @ \$613/acft/yr);
- CRWA Wells Ranch Project Phase 2 MAG Limited (7,829 acft/yr @ \$858/acft/yr);
- Vista Ridge Project MAG Limited (34,894 acft/yr @ \$2,177/acft/yr);
- New Braunfels Trinity (1,090 acft/yr @ \$634/acft/yr);
- Victoria Groundwater-Surface Water Exchange (8,544 acft/yr @ \$0/acft/yr);
- Cibolo Valley LGC Carrizo Project (10,000 acft/yr @ \$1,834/acft/yr);
- Regional Carrizo for SSLGC Project Expansion (6,500 acft/yr @ \$1,070/acft/yr); and
- Expanded Local Carrizo for SAWS MAG Limited (5,419 acft/yr @ \$700/acft/yr)

Water management strategies that simultaneously develop **brackish groundwater** supplies and limit depletion of storage in regional aquifers comprise about 1 percent of recommended new supplies and include:

- Brackish Wilcox Groundwater for CRWA MAG Limited (3,839 acft/yr @ \$2,619/acft/yr);
- Brackish Wilcox Groundwater for SAWS MAG Limited (5,622 acft/yr @ \$1,289/acft/yr);
- Expanded Brackish Project for SAWS MAG Limited (0 acft/yr);
- Brackish Wilcox (Gonzales Co.) MAG Limited (1,392 acft/yr @ \$5,032/acft/yr); and
- Brackish Wilcox Groundwater for SSWSC MAG Limited (0 acft/yr).

Water management strategies that develop new **surface water** supplies comprise 1 percent of recommended new supplies and include:

CRWA Siesta Project (5,042 acft/yr @ \$1,886/acft/yr).

Water management strategies that involve **new reservoirs** (off-channel storage) comprise approximately 16 percent of recommended new supplies and include:

- GBRA Lower Basin Storage (51,800 acft/yr @ \$140 acft/yr);
- GBRA New Appropriation (Lower Basin) (42,000 acft/yr @ \$591/acft/yr); and
- Victoria County Steam-Electric (29,100 acft/yr @ \$1,225/acft/yr).

Water management strategies that involve **aquifer storage and recovery (ASR)** comprise approximately 9 percent of recommended new supplies and include:

- GBRA Mid-Basin Project ASR (50,000 acft/yr @ \$1,637/acft/yr);
- Victoria ASR (7,900 acft/yr @ \$192/acft/yr);
- New Braunfels ASR + WTP Expansion (8,300 acft/yr @\$462acft/yr); and
- Uvalde ASR (1,155 acft/yr @ \$2,803/acft/yr).

Finally, the Regional Water Plan includes the development of two **seawater desalination** projects, comprising 23 percent of the recommended new supplies:

- SAWS Seawater Desalination (84,023 acft/yr @ \$2,713/acft/yr); and
- GBRA Integrated Water-Power Project (100,000 acft/yr @ \$2,393/acft/yr).

In addition to projects utilizing new and reuse supplies, the SCTRWPG has identified several reallocation projects within the region that include:

- Edwards Aquifer Habitat Conservation Plan
- Edwards Transfers (11,772 acft/yr @ \$1,415);
- Carrizo Conversions (Municipal, Mining, and Irrigation Users);
- Western Canyon WTP Expansion (Up to 5,600 acft/yr capacity);
- SAWS Water Resources Integration Pipeline (84,000 acft/yr capacity);
- Dos Rios WWTP CPS Pipeline (50,000 acft/yr);
- Hays County Pipeline Project (15,314 acft/yr);
- Purchase from Wholesale Water Provider;
- Surface Water Rights;
- Balancing Storage; and
- Other Local Facilities Expansions.

The South Central Texas Regional Water Planning Group identifies alternative water management strategies that have been technically evaluated in accordance with TWDB rules and may, subject to an appropriate amendment process defined by TWDB rules, replace a recommended water management strategy in the 2016 Regional Water Plan (see Appendix E).

The 2016 South Central Texas Regional Water Plan did not recommend water management strategies to meet some mining and irrigation needs, as strategies to meet those needs may be cost-prohibitive. Table ES-4 summarizes the unmet needs of the region.

	2020	2030	2040	2050	2060	2070

IRRIGATION	115,468	107,349	97,957	91,283	84,820	79,606

Table ES- 4 Summary of Unmet Needs

Implementation of the 2016 South Central Texas Regional Water Plan will result in the development of new water supplies that will be reliable in the event of a repeat of the most severe drought on record. Implementation of all recommended water management strategies is not likely to be necessary in order to meet projected needs within the planning period. The SCTRWPG explicitly recognizes the difference between additional supplies and projected needs as System Management Supplies and has recommended water management strategies over and above those apparently needed to meet projected demands in the Regional Water Plan for the following reasons:

- To recognize both the long lead times and the uncertainty associated with risk factors that may prevent implementation of water management strategies and necessitate replacement strategies;
- To preserve flexibility for water user groups or wholesale water suppliers to select the most feasible projects among several consistent with the Regional Plan and, therefore, ensure that such projects are potentially eligible for permitting and funding;
- To serve as additional supplies in the event that rules, regulations, or other restrictions limit use of any planned strategies; and/or
- To ensure adequate supplies in the event of a drought more severe than that which occurred historically.

Costs associated with the implementation and long-term operations and maintenance of water management strategies have been estimated in accordance with TWDB rules and general guidelines and reflect regional water treatment capacity and balancing storage facilities sufficient to meet peak daily and seasonal water demands in the larger urban areas. Annual unit costs for recommended water management strategies for municipal supply in the 2011 South Central Texas Regional Water Plan (in September 2013 dollars) are estimated to range from a low of about \$140/acft/yr for GBRA Lower Basin Storage (500 acre site) to a high of about \$5,032/acft/yr for the MAG Limited Brackish Wilcox (Gonz Co) for SSLGC strategy and average about \$1,291/acft/yr.

ES.8 Water Plan Summary

Recommended water management strategies to meet the projected needs of each city, utility, water user group, and wholesale water provider in the South Central Texas Region are presented in Chapter 5 and summarized in tables generated by the TWDB Regional Water Planning Database (DB17) in Appendix A. Likewise, alternative water management strategies are listed in Chapter 5.1 and summarized in tables generated by DB17 in Appendix A.

·

Chapter 1

1 Description of the South Central Texas Region

[31 TAC §357.30]

1.1 Background

Water supplies of the South Central Texas Region are obtained from the Edwards-Balcones Fault Zone, Carrizo-Wilcox, Trinity, Edwards-Trinity (Plateau), and Gulf Coast Aquifers; from six minor aquifers (Queen City, Sparta, Austin Chalk, Buda Limestone, Leona Gravel, and Yegua-Jackson); and from the rivers, streams, and reservoirs within the region. The water supply picture of the region is very complex, involving intricate relationships between surface water and groundwater. The Edwards-Balcones Fault Zone Aquifer (hereinafter referred to as the Edwards Aquifer) supplied approximately 42 percent of the total water used in the South Central Texas Region in 2010. Water demands for the counties using significant supplies from the Edwards Aguifer are projected to grow at a rate of approximately 0.76 percent per year between 2020 and 2040. However, not even the present level of use can be sustained through drought periods while maintaining levels of flows at Comal and San Marcos Springs adequate to support habitats of threatened and endangered species and also meet downstream water rights. Demands on the Trinity and Carrizo-Wilcox (hereinafter referred to as the Carrizo Aquifer) Aquifers of the South Central Texas Region exceed recharge in some areas. In other areas that now depend upon the Carrizo and Gulf Coast Aquifers, present withdrawal rates are substantially less than recharge. Throughout the region, there is an awareness of the dynamic interrelationships of surface water and groundwater and of the importance of maintaining instream flows and freshwater inflows to bays and estuaries.

Operations of the largest existing surface water supply sources in the region are also directly linked to the Edwards Aquifer. Dependable supplies from Canyon Reservoir for municipal and industrial customers are a function of springflows from the Edwards Aquifer, since inflow passage through Canyon Reservoir is necessary to meet downstream water rights when springflows drop below certain levels. Storage in the Medina Lake System contributes significantly to recharge of the Edwards Aquifer, and reservoirs used for steam-electric power generation (Coleto Creek, Calaveras, and Braunig) and hydropower generation are dependent upon springflows and/or treated municipal effluent that originate from the Edwards Aquifer. Surface water supplies available to the region are also a function of recharge to and withdrawal from the aquifers, as are the quantities of streamflows permitted for use in counties of the Nueces, San Antonio, and Guadalupe River Basins outside of the South Central Texas Region. In water planning for the South Central Texas Region, these factors, together with the numerous potential water management strategies available to the South Central Texas Region, are taken into account herein.

1.2 Physical Description of the South Central Texas Region

The South Central Texas Region includes counties that are located in whole or in part in the Rio Grande, Nueces, San Antonio, Guadalupe, Colorado, and Lavaca River Basins, and the Colorado-Lavaca, Lavaca-Guadalupe, and San Antonio-Nueces Coastal Basins (Table 1-1). The physical terrain of the region ranges from the Hill Country of the Edwards Plateau to the Coastal Plains. A general description of the region, including geology, climate, water resources, vegetational areas, and major water demand centers, is presented in the following sections.

1.2.1 Climate¹

The South Central Texas Region lies in three climatic divisions of Texas: the Edwards Plateau, the South Central, and the Upper Coast. The climate of the region is classified as humid subtropical. Summers are usually hot and humid, while winters are often mild and dry. The hot weather is rather persistent from late May through September, accompanied by prevailing southeasterly winds. There is little change in the day-to-day summer weather, except for the occasional thunderstorm, which produces much of the annual precipitation within the region. The cool season, beginning about the first of November and extending through March, is also typically the driest season of the year. Winters are ordinarily short and mild, with most of the precipitation falling as drizzle or light rain. Any accumulation of snow is a rare occurrence. Polar air masses, which penetrate the region in winter, bring northerly winds and sharp drops in temperature for short periods of time.

In the coastal region, the climate is dominated by proximity to the Gulf of Mexico and characterized by prevailing southeasterly winds. During the long humid summers, high daytime temperatures, which are common in inland areas, are moderated in coastal areas by the Gulf breeze.

Mean annual precipitation in the region ranges from a high of 38 inches per year in DeWitt County in the eastern part of the region, to a low of 23 inches per year in the Nueces River Basin in the west (Table 1-2). There is a general trend of decreasing precipitation from the eastern portions of the region to western portions. There is also a general trend of increasing precipitation from inland areas to coastal areas.

Although mean annual temperatures are basically uniform throughout the region, there are some marked seasonal variations, which lead to widely varied values for annual net reservoir surface evaporation. The values for annual net reservoir surface evaporation range from a high of 4.7 feet per year in the southwestern portion of the region to a low of 2.5 feet in the eastern portion of the region.

Table 1-2 Climatological Data for the South Central Texas Region

Source: Texas Water Development Board, "Continuing Water Resources Planning and Development for Texas, May 1977.

The South Central Texas Region is subject to the threat of hurricanes each year from mid-June through the end of October, and, in those parts of the region along and near the coastline, the hazard of hurricane tides is prevalent. Although hurricane winds and tornadoes spawned by hurricanes cause extensive damage and occasional loss of life, surveys of hurricanes reaching the Texas Coast indicate that storm tides cause by far the greatest destruction and largest number of deaths. Elsewhere, in the inland areas of the region, the greatest concern with regard to hurricanes is the damage that results from winds and flooding. Records dating back to 1871 show that, on average, a tropical storm or hurricane has affected the region once every 3 years.

1.2.2 General Geology²

The Hill Country area of the South Central Texas Region is underlain by Cretaceous Age limestone, which forms the Edwards Plateau. East and south of the Plateau are upper Cretaceous chalk, limestone, dolomite, and clay, with the extensive Balcones Fault Zone System marking the boundary between the Edwards Plateau and the Gulf Coastal Region. The entire sequence dips gently toward the southeast.

A Tertiary Age sequence of southeasterly dipping sand, silts, clay, glauconite, volcanic ash, and lignite overlie the Cretaceous Age strata. The primary water-bearing unit of this sequence is the Carrizo Aquifer. A sequence of clay, sand, caliche, and conglomerate of the Pliccene Age Goliad Formation underlie the coastal areas of the region.

Overlying the Goliad Formation is the Quaternary Age Lissie Formation, which consists of sand, silt, clay and minor amounts of gravel. Clay, silt, and fine-grained sand of the

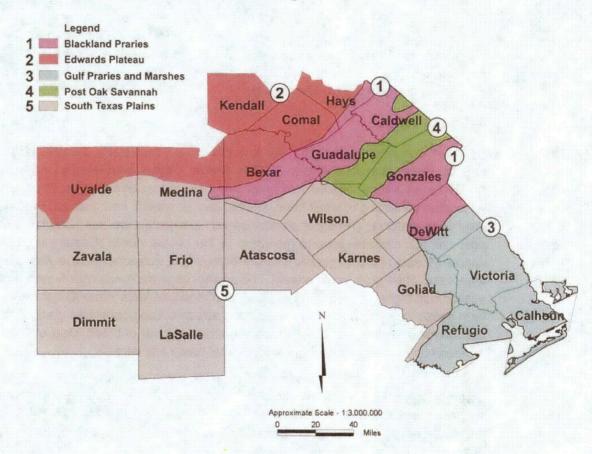

² TWDB, Op. Cit., May 1977.

Beaumont Formation overlie the Lissie Formation. Throughout the region, alluvial sediments of Recent Age occur along streams and coastal areas.

1.2.3 Vegetational Areas³

Biologically, the South Central Texas Region is a region of transition from the lowland forests of the southeastern United States to the arid grasslands of the western uplands and tropical thorn scrub to the south. The essence of this landscape consists of dendritic networks of wooded stream corridors populated by typically eastern species that dissect upland grasslands, and savannahs that harbor western species. The vegetational areas containing portions of the South Central Texas Region are the Edwards Plateau, South Texas Plains, Blackland Prairies, Gulf Prairies and Marshes, and the Post Oak Savannah (Figure 1-1). Each area is described below.

Figure 1-1 Eco-Regions — South Central Texas Region

Edwards Plateau

In the South Central Texas Region, the Edwards Plateau vegetational area includes all of Kendall County, the northern portions of Uvalde, Medina, Bexar, and Comal Counties,

3 HDR Engineering, Inc. (HDR), et al., "Trans-Texas Water Program, West Central Study Area, Phase I Interim Report," Volume 2, San Antonio River Authority, et al., May 1994.

and the western portion of Hays County located within the planning area. This limestonebased area is characterized by springfed, perennially flowing streams that originate in its interior and flow across the Balcones Escarpment, which bounds it on the south and east. This area is also characterized by the occurrence of numerous ephemeral streams that are important conduits of storm runoff, which contributes to the recharge of the Edwards Aquifer. The soils are shallow, ranging from sands to clays, and are calcareous in reaction. This area is predominantly rangeland, with cultivation confined to limited areas having deeper soils.

Noteworthy is the growth of Bald cypress (*Taxodium distichum*) along the perennially flowing streams. Separated by many miles from cypress growth of the moist Southern Forest Belt, they constitute one of Texas' several "islands" of vegetation.

The principal grasses of the clay soils are several species of bluestem (*Schizachyrium* and *Andropogon* spp.), gramas (*Bouteloua* spp.), Indiangrass (*Sorghastrum nutans*), common curlymesquite (*Hilaria belangeri*), buffalograss (*Buchloe dactyloides*), and Canadian wild rye (*Elymus canadensis*). The rocky areas support tall or mid-grasses with an overstory of live oak (*Quercus virginiana*) and other oaks (*Q. fusiformis, Q. buckleyi, Q. sinuata* var. *breviloba*), cedar elm (*Ulmus crassifolia*) and mesquite (*Prosopis glandulosa*). The heavy clay soils have a mixture of buffalograss, sideoats grama (*Bouteloua curtipendula*), and mesquite.

South Texas Plains

South of San Antonio, including all or parts of Uvalde, Zavala, Dimmit, Medina, Frio, LaSalle, Bexar, Atascosa, Wilson, Karnes, DeWitt, Goliad, and Refugio Counties, lies the South Texas Plains vegetational area, which is characterized by subtropical dryland vegetation consisting of small trees, shrubs, cactus, weeds, and grasses. Principal plants are honey mesquite (*Prosopis glandulosa* var. *torreyana*), live oak (*Quercus virginiana*), post oak (*Q. stellata*), several members of the cactus family (Cactaceae), blackbrush acacia (*Acacia rigidula*), guajillo (*Acacia berlandieri*), huisache (*Acacia farnesiana*), and others that often grow very densely. The original vegetation was mainly perennial warmseason bunchgrass in post oak, live oak, and mesquite savannahs. Other brush species form dense thickets on the ridges and along streams. Long-continued grazing, as well as the control of wildfires, has contributed to the dense cover of brush. Most of the desirable grasses have persisted under the protection of brush and cacti.

There are distinct differences in the original plant communities on various soils. Dominant grasses on the sandy loam soils are seacoast bluestem (*Schizachyrium scoparium* var. *littoralis*), bristlegrasses (*Setaria* spp.), and silver bluestem (*Bothriochloa saccharoides*). Dominant grasses on the clay and clay loams are silver bluestem, Arizona cottontop (*Trichachne californica*), buffalograss, common curlymesquite, bristlegrasses, gramas, and Texas wintergrass (*Stipa leucotricha*). Gulf cordgrass (*Spartina* spp.) and seashore saltgrass (*Distichlis spicata*) characterize low saline areas. In the post oak and live oak savannahs, the grasses are mainly seacoast bluestem, Indiangrass, and switchgrass (*Panicum virgatum*).

Blackland Prairies

This area, including parts of Bexar, Comal, Guadalupe, Hays, Caldwell, Gonzales, and DeWitt Counties, while called a "prairie," has timber along the streams, including a variety of oaks, pecan (*Carya illinoinensis*), cedar elm, and mesquite. In its native state, it was largely a grassy plain.

Most of this fertile area has been cultivated, and only small acreages of meadowland remain in original vegetation. In heavily grazed pastures, buffalograss, Texas grama (*Bouteloua rigidiseta*), and other less-productive grasses have replaced the tall bunchgrass. Mesquite and other woody plants have invaded the grasslands.

The original grass vegetation included big bluestem (*Andropogon gerardii*) and little bluestem (*Schizachyrium scoparium var. frequens*), Indiangrass, switchgrass, sideoats grama, hairy grama (*Bouteloua hirsuta*), tall dropseed (*Sporobolus asper*), Texas wintergrass, and buffalograss. Non-grass vegetation is largely legumes and composites.

Gulf Prairies and Marshes

The Gulf Prairies and Marshes vegetational area includes all or parts of Victoria, DeWitt, Goliad, Refugio, and Calhoun Counties. There are two subunits: (1) the marsh and salt grasses immediately at tidewater; and (2) a little farther inland, a strip of bluestems and tall grasses, with some gramas in the western part. Many of these grasses make excellent grazing. Oaks, elm, and other hardwoods grow to some extent, especially along streams, and the area has some post oak and brushy extensions along its borders. Much of the Gulf Prairies is fertile farmland.

Principal grasses of the Gulf Prairies are tall bunchgrasses, including big bluestem, little bluestem, seacoast bluestem, Indiangrass, eastern gamagrass (*Tripsacum dactyloides*), Texas wintergrass, switchgrass, and gulf cordgrass. Seashore saltgrass occurs on most saline sites. Heavy grazing has changed the range vegetation in many cases so that the predominant grasses are less desirable broomsedge (*Andropogon virginicus*), smutgrass (*Sporobolus indicus*), threeawns (*Aristida spp.*) and many other inferior grasses. The other plants that have invaded the productive grasslands include oak underbrush, huisache, mesquite, pricklypear (*Opuntia* spp.), ragweed (*Ambrosia psilostachya*), broomweed (*Xanthocephalum* spp.), and others.

Post Oak Savannah

This secondary forest region, also called the Post Oak Belt, includes parts of Guadalupe, Caldwell, Wilson, and Gonzales Counties. It is immediately west of the primary forest region, with less annual rainfall and a little higher elevation. Principal trees are post oak, blackjack oak (*Quercus marilandica*), and cedar elm. Pecans, walnuts (*Juglans* spp.), and other kinds of water-demanding trees grow along streams. The southwestern extension of this belt is often poorly defined, with large areas of prairie.

The original vegetation consisted mainly of little bluestem, big bluestem, Indiangrass, switchgrass, silver bluestem, Texas wintergrass, post oak, and blackjack oak. The area is still largely native or improved grasslands, with farms located throughout. Intensive grazing has contributed to dense stands of a woody understory of yaupon (*llex vomitoria*) and oak brush, and mesquite has become a serious problem. In addition, the control of

wildfires has affected the encroachment of brush species on Savannah range lands. Such plants as broomsedge, broomweed, and ragweed have replaced good forage plants.

1.2.4 Natural Resources

Water Resources

The South Central Texas Region includes parts of six major river basins (Rio Grande, Nueces, San Antonio, Guadalupe, Lavaca, and Lower Colorado) and overlies the Edwards and Gulf Coast Aquifers, and southern parts of the Trinity, Carrizo, and Edwards-Trinity (Plateau) Aquifers. In addition to these water resources, the area also overlies six minor aquifers (Queen City, Sparta, Austin Chalk, Buda Limestone, Leona Gravel, and Yegua-Jackson). Details about these water resources are presented in Chapters 1.7 and 3.

Springs are also significant water resources in the South Central Texas Region. The two most noteworthy springs are the Comal and San Marcos Springs, which both emanate from the Edwards Aquifer and contribute to flow in the Guadalupe River. The San Marcos Springs have the greatest flow dependability and environmental stability of any spring system in the southwestern United States. Constancy of its springflow is apparently key to the unique ecosystem found in the uppermost San Marcos River. Comal Springs, located in New Braunfels, are the source for the Comal River, which is a tributary of the Guadalupe River. Unlike the San Marcos Springs, Comal Springs is more responsive to drought conditions and ceased flowing in June of 1956 in response to groundwater withdrawals and severe drought conditions. In addition, numerous springs in northern Uvalde and Medina Counties provide surface flows that recharge the Edwards Aquifer and a few springs, such as Leona Springs and Soldier Springs at Uvalde, flow from below the Edwards Aquifer recharge zone providing surface flows for many miles downstream.

Fish and Wildlife Resources

The streams and reservoirs of the South Central Texas Region encompass habitats that range from the clear, rocky headwaters of the Guadalupe and Nueces Rivers on the Edwards Plateau to the sluggish, turbid river reaches of the coastal plains, all supporting fish communities typical of warm, carbonate dominated hard waters. Typical species of the coastal plains streams include gar, minnows, topminnows, sunfishes, bass, catfish, and a few species of darters and suckers. Although strongly dependent on the physical habitat factors present, typical species Edwards Plateau streams include the common carp, red shiner, blacktail shiner, topminnow, longear and bluegill sunfish, largemouth and Guadalupe bass, channel catfish, bullheads, dusky darter, bigscale logperch, and grey redhorse. The Guadalupe Estuary, at the mouth of the Guadalupe River, is habitat to brown and white shrimp, blue crabs, eastern oysters, red drum, spotted seatrout, black drum, flounder, mullet, Atlantic croaker, sharks, and kingfish.

Common types of wildlife found in the area include white-tailed deer, raccoons, ringtails, gray foxes, coyotes, bobcats, and several species of skunks. Wintering songbirds such as robins and cedar waxwings may also be found. In addition, a growing population of endangered whooping cranes winters in and near the Aransas National Wildlife Refuge

A key concern in the South Central Texas Region is that of threatened and endangered species. There are a number of species listed in the planning region by the U.S. Fish and Wildlife Service or the Texas Parks and Wildlife Department as threatened or endangered. These species are listed by county in Appendix G with notations concerning their habitat preferences and protected status, if any.

County	Total Land Area (acres)	Farms and Ranches (number)	Land in Farms and Ranches (acres)	Average Size (acres)	Total Cropland (acres)	Harvested Cropland (acres)	Irrigated Land (acres)

			cated in the plan Geographic Area			Summary Highl	ights — 2012."

Table 1-3 Agricultural Resources — 2012 South Central Texas Region

Agricultural Resources

Of the 12.8 million acres of land area in the planning region, over 10.57 million acres (83 percent) are classified as farmland and ranchland (Table 1-3). In 2012, there were 26,234 farms and ranches in the region with an average size of 403 acres. Of the 10.57 million acres of farmland, over 1.60 million acres were classified as cropland, of which about 1.01 million acres were harvested in 2012. Approximately 17 percent (274,858 acres) of the total cropland in the region was reported to be irrigated in 2012⁴. The leading irrigation counties are located in the western part of the region and include Frio, Medina, Uvalde, Zavala, and Atascosa. The sum of irrigated acres in these five counties increased by 22.0 percent between 2007 and 2012. In Medina and Uvalde Counties, which rely primarily on the Edwards Aquifer, irrigated acres increased by 24.8 and 9.2 percent, respectively, between 2007 and 2012. Major irrigated crops are corn, cotton, grain sorghum, wheat, rice, soybeans, and vegetables. Cow-calf operations are the predominant type of livestock industry, although beef cattle, hogs and pigs, sheep and lambs, and poultry are also produced. Agricultural production and livestock production are discussed in greater detail in Chapters 1.4.2 and 1.4.3, respectively.

1.2.5 Major Water Demand Centers

In the South Central Texas Region, there are four major water demand centers. These centers are the Interstate Highway 35 (IH-35) corridor from San Antonio to San Marcos, the Edwards Aquifer region west of the City of San Antonio, the Winter Garden area south of the Edwards Aquifer area, and the Coastal area. The San Antonio, New Braunfels, and San Marcos corridor along IH-35 is one of the fastest growing areas in Texas. In the next 60 years, its water use will follow the same trend as population growth, with most of the demand being for municipal use.

The Edwards Aquifer region west of San Antonio, including Uvalde and Medina Counties, is a major demand center for water to be used for irrigated agriculture. The Winter Garden area, including Zavala, Dimmit, Frio, LaSalle, and Atascosa Counties, is also a major demand center for water for irrigated agriculture. The Coastal area, including the cities of Victoria and Port Lavaca, are major demand centers for water for industrial purposes, with some demand for irrigation in Calhoun County.

1.3 Population and Demography

1.3.1 Historical and Recent Trends in Population

According to the Bureau of the Census, the South Central Texas Region population has increased from 1,014,752 in 1960 to 2,535,451 in 2010, an increase of 1,520,699 or 2.5 times (Table 1-4). The largest percentage increase occurred between the years 2000 and 2010 (24.2 percent), while the smallest occurred between 1960 and 1970 (16.2 percent). During the period 1960 to 2010, 16 counties had a positive annual growth rate, while five counties (DeWitt, Dimmit, Karnes, Refugio, and Zavala) had a negative annual growth rate. Historically, the fastest growing counties in the region were Hays (4.22 percent), Kendall (3.53 percent), Comal (3.46 percent), and Guadalupe

^{4 2012} Census of Agriculture, Volume 1 Geographic Area Series, "Table 1. County Summary Highlights: 2012."

(3.07 percent), while the slowest growing counties were Gonzales (0.21 percent), LaSalle (0.29 percent), Calhoun (0.51 percent), and Goliad (0.57 percent). Chapter 2.1 summarizes population projections through the year 2070 for the South Central Texas Region.

Source: Bureau of the Census, Decadal Censuses of 1960, 1970, 1980, 1990, 2000, and 2010, U.S. Department of Commerce.

There are 119 cities or other water supply entities (excluding County-Other) in the South Central Texas Region for which the TWDB has made population and water demand projections. Of the 119 cities and entities, 52 have a projected population in 2020 greater than 5,000. These entities are relatively equally distributed among the 21 counties in the

planning region and are located in three commonly used regional references (Coastal, Hill Country, and Winter Garden) (Table 1-5). Bexar County contains 16 entities having a projected population of 5,000 or more, including San Antonio and its surrounding suburbs. Four counties, Goliad, Karnes, La Salle, and Refugio, do not have an entity of 5,000 or greater in projected population by 2020.

1.3.2 Demographic Characteristics

In 2010, 83 percent of the South Central Texas Region population resided in urban areas, while only 17 percent resided in rural areas (Figure 1-2). LaSalle County had the lowest population in 2010, with 6,886 residents (averaging 4.6 persons per square mile), while Bexar County had the highest population in the region with 1,714,773 residents (averaging 1,375 persons per square mile) (Table 1-6).

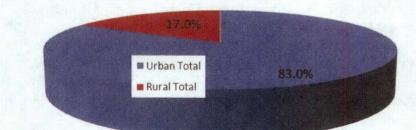

Age distribution across the region is characterized by a relatively young population. The two age groups that include the highest percentage of the population are under 20 years of age (29.8 percent) and from 25 to 34 years of age (13.8 percent) (Figure 1-3). The age groups with the lowest percentage of the population are ages 20 to 24 (7.7 percent) and ages 55 to 64 (10.7 percent) (Figure 1-3).

Figure 1-3 Age Distribution of the Population (2010) South Central Texas Region

Source : 2010 U.S. Census Data

The regional population can also be characterized by its level of education. Of those residents in the South Central Texas Region who are 25 years of age or older, 81.3 percent have at least a high school diploma, while 18.7 percent do not. The two largest groups rated according to educational achievement are those who have completed high school, but have not gone on to college (26.9 percent) and those who have completed some college education, but have no degree (23.2 percent). Only 8.5 percent of the population who are 25 years or older have a graduate degree (Figure 1-4).

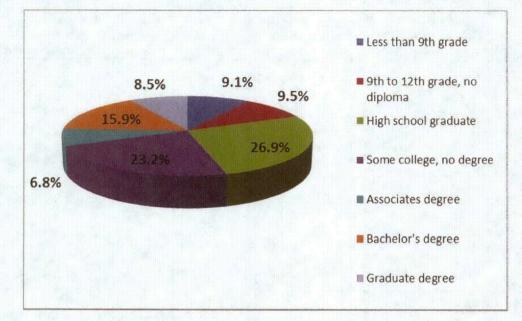

Figure 1-4 Level of Educational Achievement (2010) South Central Texas Region

1.4 Economy — Major Sectors and Industries

1.4.1 Summary of the South Central Texas Regional Economy

The South Central Texas Region has an economic base centered on agricultural production, livestock production, mining, manufacturing, and trades and services. The region has experienced economic ups and downs throughout the past decade, but all sectors of the economy have experienced solid growth in recent years. Table 1-7 provides a county-by-county summary of economic activity in the key sectors most significantly affecting the economy of the South Central Texas Region. A strong trades and services sector, including a thriving tourism industry in San Antonio, comprises about 48 percent of regional economic activity summarized in Table 1-7. Fabricated metal products, industrial machinery, petrochemicals, and food processing form the core of the manufacturing sector, which accounts for approximately 27 percent of regional economic activity. Beef cattle, corn, and grain sorghum are the dominant agricultural enterprises, although vegetables produced in the Winter Garden area add diversity to the agricultural sector. The agricultural sector, including both livestock and crops, accounts for about 3 percent of regional economic activity. Finally, oil and gas production dominate the mining sector of the economy and, together, represent about 22 percent of the regional economic activity summarized in Table 1-7. Additional information regarding the agricultural, livestock, mining, manufacturing, and trades and services sectors is presented in the following sections.

County	Trades & Services Economic Activity (million dollars) ¹	Manufacturing Economic Activity (million dollars) ¹	All Livestock	Market Value of All Crops (million dollars) ²	Value of Oil Production (million dollars) ³	Value of Gas Production (million dollars) ⁴	Total (million dollars)

3. Determined by using the number of barrels produced as reported to the Texas Railroad Commission times \$94.05/bbl (the average price for 2010).

4. Determined by using the mcf produced as reported to the Texas Railroad Commission times \$2.65/mcf (the average price for 2010).

5. Estimated that 70% of economic activity within Hays County takes place within the planning region.

1.4.2 Agricultural Production

It is estimated that over 1.6 million acres in the South Central Texas Region were used in crop production in 2012. Of this total, only 274,858 acres (17.1 percent) were irrigated while the remaining 82.9 percent of the total cropland was farmed using dryland techniques. The leading irrigation counties are found primarily in the western part of the region and include Frio, Medina, Uvalde, Zavala, and Atascosa.

According to the 2012 Census of Agriculture, all crops grown in the South Central Texas Region had a market value of over \$577 million in 2012. The leading agricultural producing counties in the region, by market value of products, are Frio, Medina, Uvalde, Bexar, and Refugio. The major crops grown in the region include corn, grain sorghum, wheat, soybeans, and cotton (Livestock Production).

According to the 2012 Census of Agriculture, livestock marketed in the South Central Texas region had a value of over \$1.1 billion, or about 1.9 times the value of all crop production (Table 1-7). Major types of livestock produced in the area include cattle and calves, beef cattle, and sheep and lambs. Layers, pullets, and broilers also contribute significantly to livestock production, with Gonzales County producing over 97 percent of these types of chickens within the region. Table 1-9 provides a county-by-county summary of livestock production. In 2012, the leading livestock producing counties in the region by market value were Gonzales, Frio, and Wilson Counties (Table 1-7).

Corn and grain sorghum have historically been the leading crops in the region. In 2012, it was estimated that over 16 million bushels of corn were harvested in the South Central Texas Region. The leading corn producing counties in the region are Medina, Uvalde, Frio, and Victoria (Table 1-8). Grain sorghum also contributes significantly to the agricultural sector. In 2012, it was estimated that over 10 million bushels of grain sorghum were harvested in the region. The leading grain sorghum producing counties in the region are Refugio, Calhoun, Victoria, and Guadalupe (Table 1-8). Although wheat production is not as widespread as corn and grain sorghum production, it is still an important part of the regional agricultural production with over 3.5 million bushels of wheat harvested in 2012. The leading wheat producing counties in the region are Uvalde, Frio, Medina, and Guadalupe (Table 1-8).

Because of favorable climatic and soil conditions, the coastal counties of Calhoun and Victoria are able to produce rice. In 2012, these two counties combined produced over 244,000 hundredweight (cwt) of rice (Table 1-8). Cotton production is widespread throughout the region. In 2012, the 19 counties in which cotton is produced combined to harvest over 229,000 bales. (Table 1-8). Leading counties for cotton production were Medina, Refugio, and Uvalde.

Soybean production in the region reportedly occurs in 8 counties, but total production and leading counties are uncertain due to data withheld to avoid disclosure of production by individual producers.

1.4.3 Livestock Production

According to the 2012 Census of Agriculture, livestock marketed in the South Central Texas region had a value of over \$1.1 billion, or about 1.9 times the value of all crop production (Table 1-7). Major types of livestock produced in the area include cattle and calves, beef cattle, and sheep and lambs. Layers, pullets, and broilers also contribute significantly to livestock production, with Gonzales County producing over 97 percent of these types of chickens within the region. Table 1-9 provides a county-by-county summary of livestock production. In 2012, the leading livestock producing counties in the region by market value were Gonzales, Frio, and Wilson Counties (Table 1-7).

1.4.4 Mining

The South Central Texas Region has many sand and gravel quarries and is also rich in petroleum products including oil, natural gas, and lignite. Much of the stone quarried is used in the production of cement. The leading cement producing areas in the region are located in Bexar and Hays Counties. Most of the stone, gravel, and sand mining activities are located in Bexar, Comal, Gonzales, and Victoria Counties.

The region also derives a significant portion of its mining income from oil and gas activities. All but five counties (Comal, Hays, La Salle, Medina, and Uvalde) in the region

had economic activity derived from oil and gas production in 2012. Oil and gas production in the remaining 16 counties generated over \$14.5 billion in 2012. The leading oil and gas producing counties in the region were Karnes, Gonzales, Kendall, DeWitt, and Dimmit (Table 1-7).

1.4.5 Manufacturing⁵

In 2007, manufacturing facilities contributed over \$17.5 billion in sales in the South Central Texas Region (Table 1-7).⁶ The leading manufacturing counties in the region for which data are disclosed, by value of shipments, are Bexar, Guadalupe, Comal, and Hays. Significant economic activity associated with manufacturing also occurs in Calhoun and Victoria Counties, though data is withheld to avoid disclosures for individual producers. Types of manufacturing plants and products in the region include plastics; nylon intermediates; automobiles; printing and related support activities; fabricated metal products; miscellaneous products; and food products.

1.4.6 Trades and Services⁷

In 2007, wholesale trade, retail trade, and services contributed over \$31.5 billion in sales or receipts in the South Central Texas Region (Table 1-7).⁸ The leading trades and services counties, by value of sales or receipts, in the region are Bexar, Comal, Victoria, Guadalupe, and Hays.

1.5 Water Uses⁹

Water use in 2012 within the South Central Texas Region as reported to or estimated by the TWDB is summarized by source for each of the use types in Table 1-10.

In 2012, total water use in the region was estimated to be 981,165 acft/yr. Municipal use accounted for 407,564 acft (or 41.5%) and irrigation use accounted for 370,626 acft (or 37.8%) of the total water use within the region. Surface water use totaled 230,403 acft (23.5%) and groundwater use made up the remaining 750,762 acft (76.5%). Surface water is the primary source for manufacturing and steam-electric power generation uses and groundwater is the primary source for other use types.

Table 1-10 Summary of Water Use – 2012 (acft/yr) South Central Texas Region

1.6 Wholesale Water Providers

The TWDB defines a Wholesale Water Provider (WWP) as any person or entity, including river authorities and irrigation districts, that has contracts to sell more than 1,000 acft of water wholesale in any one year during the five years immediately preceding the adoption of the most recent regional water plan. Under this definition, the list of WWPs for the South Central Texas Region includes:

- San Antonio Water System (SAWS);
- Guadalupe-Blanco River Authority (GBRA);
- Canyon Region Water Authority (CRWA);
- Schertz-Sequin Local Government Corporation (SSLGC); and
- Springs Hill WSC (SHWSC).

In addition, the recently-formed Texas Water Alliance (TWA), the Cibolo Valley Local Government Corporation (CVLGC), and the Hays-Caldwell Public Utility Agency (HCPUA) are included as WWPs because they are expected to enter into contracts to sell more than 1,000 acft/yr wholesale during the planning period. Each wholesale water provider is briefly described in the following sections. Detailed water demand projections for each wholesale water provider are presented in Chapter 2.10.

1.6.1 San Antonio Water System

The San Antonio Water System (SAWS) is a public utility owned by the City of San Antonio and its primary water supply source is the Edwards Aquifer. Additional sources include the Carrizo-Wilcox and Trinity Aquifers, Canyon Reservoir, the Medina Lake System, and direct reuse. SAWS serves more than 1.3 million people in the urbanized portion of Bexar County. SAWS provides part or all of the water supplies for fourteen utility systems, retail water supplies for most, but not all, of the City of San Antonio, and a portion of the industrial supplies in Bexar County. SAWS is the sole water provider for the Cities of Balcones Heights, Castle Hills, China Grove, Elmendorf, Hill County Village, Hollywood Park, Olmos Park, Somerset, and Terrell Hills, and provides part of the water supply for Helotes, Leon Valley, Live Oak, East Central WSC, and Atascosa Rural WSC.

1.6.2 Guadalupe-Blanco River Authority

The Guadalupe-Blanco River Authority (GBRA) was created by the Texas Legislature in 1933 for the purposes of developing, storing, preserving, and distributing the waters of the Guadalupe River Basin for all useful purposes. GBRA is a regional entity serving Hays, Comal, Guadalupe, Caldwell, Gonzales, DeWitt, Victoria, Kendall, Refugio, and Calhoun Counties. GBRA's activities include supplying hydroelectric power through operations of six hydroelectric dams located on the Guadalupe River in Guadalupe and Gonzales Counties, supplying potable water, treatment of wastewater, and supplying raw water through management of substantial run-of-river rights in the lower basin and storage rights in Canyon Reservoir. GBRA is in the process of developing water supplies from sources including surface water in the Guadalupe-San Antonio River Basin and developing transmission and treatment facilities to deliver these supplies to customers.

1.6.3 Canyon Regional Water Authority

Canyon Regional Water Authority (CRWA) is a subdivision of the State of Texas created by the Texas Legislature in 1989. CRWA is the water planning and development agency for water purveyors that serve large areas of Guadalupe County and portions of Bexar, Hays, Caldwell, Wilson, and Comal Counties. It works as a partnership of 11 water supply corporations, cities, and districts responsible for acquiring, treating, and transporting potable water (Chapter 2.10). CRWA owns and operates treatment plants at Lake Dunlap on the Guadalupe River and in far western Caldwell County near the San Marcos River for surface water purchased from the GBRA or leased from other water rights owners.

1.6.4 Schertz-Seguin Local Government Corporation

The Cities of Schertz, located partially in Guadalupe County and partially in Bexar County, and Seguin, located in Guadalupe County, joined to create the Schertz-Seguin Local Government Corporation (SSLGC). This corporation is responsible for creating and operating a wholesale water supply system to serve the long-term needs of these two communities. In addition, SSLGC sells water to Selma, Universal City, Converse, Springs Hill WSC, and SAWS (Chapter 2.10). The Carrizo Aquifer in Gonzales and Guadalupe Counties is the current source of supply for SSLGC. SSLGC is pursuing the development of additional water supplies from the Carrizo and Wilcox Aquifers.

1.6.5 Springs Hill WSC

Springs Hill Water Supply Corporation (WSC) is a retail and wholesale water supplier serving customers located primarily in Guadalupe County. Springs Hill WSC provides retail water service within the WSC's service area as well as wholesale water to Crystal Clear WSC. A portion of the Springs Hill WSC service area is located inside the City of Seguin. In addition, a portion of the service area is also included in the projected demands for Guadalupe County-Other.

1.6.6 Texas Water Alliance

The Texas Water Alliance (TWA) is a group of landowners located in northeast Gonzales County organized for the purpose of selling groundwater on a wholesale basis to WWPs and water user groups (WUGs) most likely located in the South Central Texas Regional Water Planning Area (Region L). To date, several WWPs and WUGs have shown measures of interest in groundwater supplies potentially available from northeast Gonzales County. Although TWA has obtained groundwater production permits from the Gonzales County Underground Water Conservation District, it is uncertain at this time which one or more of these entities will enter into water supply agreements with the TWA.

1.6.7 Hays-Caldwell Public Utility Agency

The Hays-Caldwell Public Utility Agency (HCPUA) was formed by the Canyon Regional Water Authority, Buda, Kyle, and San Marcos for the purposes of sharing water supplies and costs of infrastructure development. The HCPUA was created under Chapter 422 of the Local Government Code General Law in January 2007. Participants in the HCPUA, who are part owners based on an agreed percentage distribution, could take the role(s) of wholesale water distributors and/or retail water purveyors.

1.6.8 Cibolo Valley Local Government Corporation

The Cibolo Valley Local Government Corporation (CVLGC) is a partnership between the Cities of Cibolo and Schertz created to develop more groundwater supplies within the local area.

1.7 Water Resources and Quality Considerations

1.7.1 Groundwater¹⁰

There are five major and six minor aquifers supplying water to the South Central Texas Region. The five major aquifers are the Edwards, Carrizo, Trinity, Gulf Coast, and Edwards-Trinity (Plateau) (Figure 1-5). The six minor aquifers are the Austin Chalk, Buda Limestone, Leona Gravel, Sparta, Queen City, and Yegua-Jackson. Each aquifer is described and a general assessment of water quality is provided in the following subsections. A summary of estimated groundwater supplies is presented in Chapter 3.

Edwards-Balcones Fault Zone Aquifer (Edwards Aquifer)

The Edwards Aquifer underlies parts of nine counties (Uvalde, Medina, Bexar, Atascosa, Comal, Guadalupe, Hays, Frio, and Zavala) in the South Central Texas Region. The aquifer forms a narrow belt extending from a groundwater divide in Kinney County through the San Antonio area northeastward to the Leon River in Bell County. A groundwater divide near Kyle, in Hays County, hydrologically separates the aquifer into the San Antonio and the Austin regions except during severe drought. The name Edwards-BFZ distinguishes this aquifer from the Edwards-Trinity (Plateau) and the

¹⁰ Data supplied by the Texas Water Development Board.

Edwards-Trinity (High Plains) Aquifers, however, in this document, it will be referred to as the Edwards Aquifer (Figure 1-5).

The aquifer consists primarily of partially dissolved limestone having high permeability. Aquifer thickness ranges from 200 to 600 feet, and freshwater saturated thickness averages 560 feet in the southern part of the aquifer. The groundwater, although hard, is generally fresh and contains less than 500 milligrams per liter of total dissolved solids. The aquifer feeds several well-known springs, including Comal Springs in Comal County, which is the largest spring in the State, and San Marcos Springs in Hays County, which is the second largest. Hueco, San Pedro, San Antonio, and Leona Springs also discharge from the aquifer. Because of its highly permeable nature, Edwards water levels and spring flows respond quickly to rainfall, drought, and pumping.

Water from the aquifer is primarily used for municipal, irrigation, industrial, and recreational purposes. San Antonio obtains most of its water supply from the Edwards Aquifer.

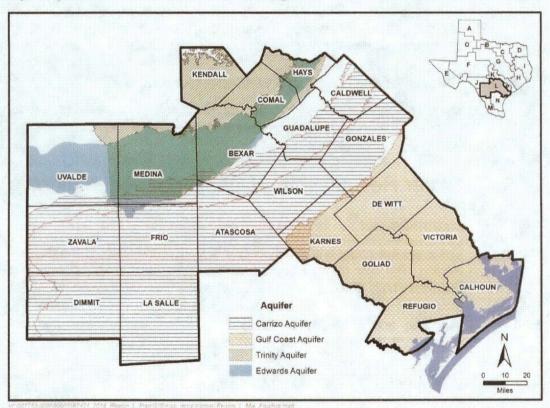

Figure 1-5 Major Aquifers — South Central Texas Region

Carrizo-Wilcox Aquifer (Carrizo Aquifer)

The Wilcox Group, including the Calvert Bluff, Simsboro, and Hooper Formations, and the overlying Carrizo Formation of the Claiborne Group, form a hydrologically connected system known as the Carrizo-Wilcox Aquifer, which is sometimes referred to in this plan as the Carrizo Aquifer. The Carrizo-Wilcox Aquifer is a major aquifer extending from the Louisiana border to the border of Mexico. The aquifer is composed of sand locally interbedded with gravel, silt, clay, and lignite. Although the Carrizo-Wilcox Aquifer

reaches 3,000 feet in thickness, the freshwater saturated thickness of the sands averages 670 feet. The groundwater, although hard, is generally fresh and typically contains less than 500 milligrams per liter of total dissolved solids in the outcrop, whereas softer groundwater with total dissolved solids of more than 1,000 milligrams per liter may occur in the confined zone. High iron and manganese content is excess of secondary drinking water standards is characteristic of the deeper, confined portions of the aquifer. Parts of the aquifer in the Winter Garden area are slightly to moderately saline, with total dissolved solids ranging from 1,000 to 7,000 milligrams per liter. Irrigation accounts for slightly more than half the water pumped, and pumping for municipal supply accounts for another 40 percent. Water levels have declined in the Winter Garden area because of irrigation pumping and in the northwestern part of the aquifer because of municipal pumping.

Trinity Aquifer

The Trinity Aquifer provides water to all or parts of 55 counties in Texas, including six counties (Hays, Comal, Kendall, Bexar, Medina, and Uvalde) in the South Central Texas Region. The Trinity Aguifer is composed of several smaller aguifers contained within the Trinity Group. Although referred to differently in different parts of the state, they include the Antlers, Glen Rose, Paluxy, Twin Mountains, Travis Peak, Hensell, and Hosston Aquifers. These aquifers consist of limestones, sands, clays, gravels, and conglomerates. Their combined freshwater saturated thickness averages about 600 feet in North Texas and about 1.900 feet in Central Texas. In general, groundwater is fresh but very hard in the outcrop of the aquifer. Total dissolved solids increase from less than 1,000 milligrams per liter in the east and southeast to between 1,000 and 5,000 milligrams per liter, or slightly to moderately saline, as depth to the aguifer increases. Sulfate and chloride concentrations also tend to increase with depth. The aguifer is one of the most extensive and highly used groundwater resources in Texas. Although its primary use is for municipalities, it is also used for irrigation, livestock, and domestic purposes.

Gulf Coast Aquifer

The Gulf Coast Aquifer is a major aquifer paralleling the Gulf of Mexico coastline from the Louisiana border to the border of Mexico. It consists of several aquifers, including the Jasper, Evangeline, and Chicot Aquifers, which are comprised of discontinuous sand, silt, clay, and gravel beds. The maximum total sand thickness of the Gulf Coast Aquifer ranges from 700 feet in the south to 1,300 feet in the north. Freshwater saturated thickness averages about 1,000 feet. Water quality varies with depth and locality: it is generally good in the central and northeastern parts of the aquifer, where the water contains less than 500 milligrams per liter of total dissolved solids, but declines to the south, where it typically contains 1,000 to more than 10,000 milligrams per liter of total dissolved solids and where the productivity of the aquifer decreases. High levels of radionuclides, thought to be naturally occurring, are found in some wells in Harris County in the outcrop and in South Texas. The aquifer is used from municipal, industrial, and irrigation purposes. In Harris, Galveston, Fort Bend, Jasper and Wharton counties, water level declines of as much as 350 feet have led to land subsidence.

Edwards-Trinity (Plateau) Aquifer

The Edwards-Trinity (Plateau) Aquifer is a major aquifer extending across much of the southwestern part of the State. The water-bearing units are composed predominantly of limestone and dolomite of the Edwards Group and sands of the Trinity Group. Although maximum saturated thickness of the aquifer is greater than 800 feet, freshwater saturated thickness averages 433 feet. Water quality ranges from fresh to slightly saline, with dissolved solids ranging from 100 to 3,000 milligrams per liter, and the water is generally characterized as hard within the Edwards Group. Water typically increases in salinity to the west within the Trinity Group. Springs occur along the northern, eastern, and southern margins of the aquifer, primarily near the bases of the Edwards and Trinity Groups where exposed at the surface. San Felipe Springs, near Del Rio, is the largest exposed spring along the southern margin. Of the groundwater pumped from this aquifer, more than two-thirds is used for irrigation, with the remainder used for municipal and livestock supplies. Water levels have remained relatively stable because recharge has generally kept pace with the relatively low amounts of pumping over the extent of the aquifer.

Sparta Aquifer

The Sparta Aquifer is a minor aquifer extending across East and South Texas, parallel to the Gulf of Mexico coastline and about 100 miles inland. Water is contained within a part of the Claiborne Group known as the Sparta Formation, a sand-rich units interbedded with silt and clay layers and with massive sand beds in the bottom section. The thickness of the formation changes gradually from more than 700 feet at the Sabine River to about 200 feet in South Texas. Freshwater saturated thickness averages about 120 feet. In outcrop areas and for a few miles in the subsurface, the water is usually fresh, with an average concentration of 300 milligrams per liter of total dissolved solids; however, water quality deteriorates with depth (below about 2,000 feet), where the groundwater has an average concentration of 800 milligrams per liter of total dissolved solids. Excess iron concentrations are common throughout the aquifer. Water from the aquifer is predominantly used for domestic and livestock purposes, and its quality has not been significantly affected by pumping. No significant water level declines have been detected throughout the aquifer in wells measured by the TWDB.

Queen City Aquifer

The Queen City Aquifer is a minor but widespread aquifer that stretches across the Texas upper coastal plain. Water is stored in the sand, loosely cemented sandstone, and interbedded clay layers of the Queen City Formation that reaches 2,000 feet in thickness in South Texas. Average freshwater saturation in the Queen City Aquifer is about 140 feet. Water is generally fresh, with an average concentration of total dissolved solids of about 300 milligrams per liter in the recharge zone and about 750 milligrams per liter deeper in the aquifer. Although salinity decreases from south to north, areas of excessive iron concentration and high acidity occur in the northeast. The aquifer is used primarily for livestock and domestic purposes, with significant municipal and industrial use in northeast Texas. Water levels have remained fairly stable over time in the northern part of the aquifer. Water level declines are more common in the central (10 to 70 feet) and southern (5 to 130 feet) parts of the aquifer.

Yegua-Jackson Aquifer

The Yegua-Jackson Aguifer is a minor aguifer stretching across the southeast part of the state. It includes water bearing parts of the Yegua Formation (part of the upper Claiborne Group) and the Jackson Group (comprising the Whitsett, Manning, Wellborn, and Caddell formations). These geologic units consist of interbedded sand, silt, and clay lavers originally deposited as fluvial and deltaic sediments. Freshwater saturated thickness averages about 170 feet. Water quality varies greatly owning to sediment composition in the aquifer formations, and in all areas the aquifer becomes highly mineralized with depth. Most groundwater is produced from the sand units of the aguifer where the water is fresh and ranges from less than 50 to 1,000 milligrams per liter of total dissolved solids. Some slightly to moderately saline water, with concentrations of total dissolved solids ranging from 1,000 to 10,000 milligrams per liter, also occurs in the aguifer. No significant water level declines have occurred in wells measured by the TWDB. Groundwater for domestic and livestock purposes is available from shallow wells over most of the aquifer's extent. Water is also used for some municipal, industrial, and irrigation purposes.

Austin Chalk, Buda Limestone, and Leona Gravel Aquifers

The Austin Chalk and Buda Limestone are Upper Cretaceous in age. The Del Rio Clay provides a confining layer between the deeper Edwards Aquifer and shallower Buda Limestone, and the Eagle Ford Group separates the lower Buda and upper Austin Chalk formations. There are limited areas where the Buda Formation and the Austin Chalk Formation are at the right elevations and have sufficient hydraulic conductivity to produce significant quantities of water. Water quality in the Austin Chalk and Buda Limestone Formations are similar to the Edwards Aquifer and there is likely some interconnectivity between the aquifers. While most wells completed in this formations are for domestic or livestock use, there are some higher flowing municipal wells as well.

The Leona Formation includes alluvial aquifers adjacent to the Leona, Nueces, Frio, and other rivers in Central and South Texas. These alluvial aquifers generally depend on associated stream flow, springs, and recharge from adjacent aquifers, and are therefore subject to depletion during drought conditions. The majority of wells in this formation are small-flow domestic or livestock wells.

1.7.2 Surface Water

The South Central Texas Region includes parts of the Rio Grande, Nueces, San Antonio, Guadalupe, Colorado, and Lavaca River Basins and parts of the Colorado-Lavaca, Lavaca-Guadalupe, and San Antonio-Nueces Coastal Basins (Figure 1-6). Existing surface water supplies of the region include those derived from storage reservoirs and run-of-river water rights. The geographical characteristics of the various river basins are described in the following subsections, along with major reservoirs and/or water rights. Existing surface water supplies available during drought are summarized in Chapter 3.

Rio Grande Basin

The southwestern corner of Dimmit County, an area of approximately 164 square miles, is located in the Rio Grande Basin and in the South Central Texas Region. The only

surface water presently available to this area is that which can be captured in stock tanks.

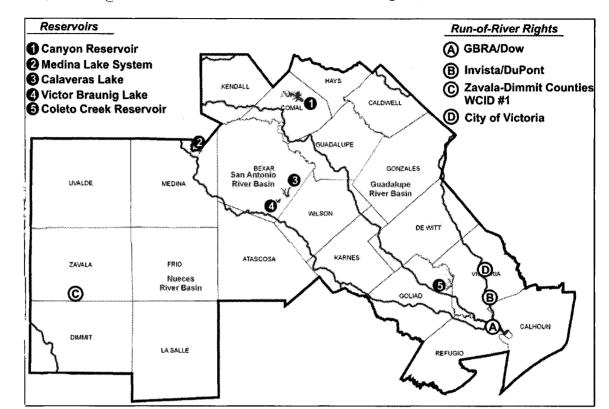

Figure 1-6 Major River Basins, Reservoirs, and Run-of-River Rights

Nueces River Basin

The Nueces River Basin is bounded on the north and east by the Colorado, San Antonio, and Guadalupe River Basins and the San Antonio-Nueces Coastal Basin, and on the west and south by the Rio Grande Basin and the Nueces-Rio Grande Coastal Basin. Total drainage area of the basin is about 16,920 square miles above Calallen Dam, of which 8,973 square miles are located in the South Central Texas planning region. The Nueces River rises in Edwards County and flows 371 river miles from the gage at Laguna in Uvalde County to Nueces Bay on the Gulf of Mexico near Corpus Christi. Principal tributaries of the Nueces River are the Frio and Atascosa Rivers. Major population centers located in the basin include the cities of Uvalde (Uvalde County), Crystal City (Zavala County), Pearsall (Frio County), Pleasanton (Atascosa County), Hondo (Medina County), and Carrizo Springs (Dimmit County). Major water rights in the Nueces River Basin within the South Central Texas Region include those held by the Zavala-Dimmit County WCID #1, which total 28,000 acft/yr.

San Antonio River Basin

The San Antonio River Basin is bounded on the north and east by the Guadalupe River Basin and on the west and south by the Nueces River Basin and the San Antonio-Nueces Coastal Basin. Total drainage area of the basin is about 4,180 square miles, of which 3,506 square miles are located in the planning region. The San Antonio River has its source in large springs within and near the city limits of San Antonio. The river flows more than 230 river miles across the Coastal Plain to a junction with the Guadalupe River near the Gulf of Mexico. Its principal tributaries are the Medina River and Cibolo Creek, both spring-fed streams. Major population centers located in the basin include the cities of San Antonio (Bexar County), Universal City (Bexar County), Schertz (Bexar County), Live Oak (Bexar County), Leon Valley (Bexar County), Converse (Bexar County), Kirby (Bexar County), Alamo Heights (Bexar County), and Floresville (Wilson County). The largest water rights in the San Antonio River Basin are associated with major reservoirs including the Medina Lake System (66,750 acft/yr), Calaveras Lake (37,000 acft/yr), and Braunig Lake (12,000 acft/yr).

Guadalupe River Basin

The Guadalupe River Basin is bounded on the north by the Colorado River Basin, on the east by the Lavaca River Basin and the Lavaca-Guadalupe Coastal Basin, and on the west and south by the Nueces and San Antonio River Basins. The Guadalupe River rises in the west-central part of Kerr County. A spring-fed stream, it flows eastward through the Hill Country until it issues from the Balcones Escarpment near New Braunfels. It then crosses the Coastal Plain to San Antonio Bay. Its total length is more than 430 river miles, and its drainage area is approximately 10,128 square miles above the Lower Guadalupe Saltwater Barrier and Diversion Dam, of which about 4,180 square miles are located within the San Antonio River Basin. Its principal tributaries are the San Marcos River, another spring fed stream, which joins the Guadalupe River in Gonzales County; the San Antonio River, which joins it just above its mouth on San Antonio Bay; and the Comal River, which joins it at New Braunfels. Comal Springs are the source of the Comal River, which flows about 2.5 miles before joining the Guadalupe River. Major population centers located in the basin include the cities of Victoria (Victoria County), San Marcos (Havs County), New Braunfels (Comal County), Seguin (Guadalupe County), Lockhart (Caldwell County), Cuero (DeWitt County), Gonzales (Gonzales County), and Luling (Caldwell County). Major reservoirs in the Guadalupe River Basin include Canyon Reservoir with authorized diversions averaging 90,000 acft/yr and Coleto Creek Reservoir with authorized diversions from the Guadalupe River of up to 20,000 acft/yr (excluding supplemental supplies from Canyon Reservoir). In addition, there are groups of run-of-river water rights having significant authorized annual consumptive uses. These rights are held by the GBRA and the Dow Chemical Company (175,501 acft/yr), INVISTA/DuPont (33,000 acft/yr), and the City of Victoria (27,007 acft/yr).

Lower Colorado River Basin

Only a small portion of Kendall and Caldwell Counties is located in that part of the Lower Colorado River Basin located inside the planning region. The total drainage area of the Colorado River Basin is 41,763 square miles, of which only 76 square miles are located in the planning region. The only surface water presently available to these two areas of the South Central Texas Region is from local stock tanks.

Lavaca River Basin

Small portions of DeWitt, Gonzales, and Victoria Counties are located in that part of the Lavaca River Basin inside the planning region. The total drainage area of the Lavaca River Basin is 2,309 square miles, of which 156 square miles are located in the planning region. The Lavaca-Navidad River Authority owns and operates Lake Texana and has contracts to provide raw water to Formosa Plastics Corporation in the Colorado-Lavaca Coastal Basin and Corpus Christi in the Nueces-Rio Grande Coastal Basin.

Coastal Basins

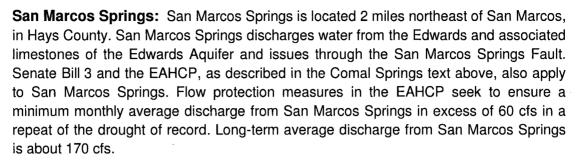

Parts of the Colorado-Lavaca, Lavaca-Guadalupe, and San Antonio-Nueces Coastal Basins are located within the South Central Texas Region. None of these coastal basins has large surface water projects. Because of limited surface water availability from local runoff and groundwater quality considerations, these basins generally rely on adjoining river basins to provide surface water to meet their needs. The Colorado-Lavaca Coastal Basin obtains surface water from Lake Texana in the Lavaca River Basin. The Lavaca-Guadalupe Coastal Basin obtains surface water imported from the Guadalupe River. The San Antonio-Nueces Coastal Basin obtains imported surface water supplied from the Nueces River Basin.

1.7.3 Major Springs

According to selected references,^{11,12} there are six major springs located within the planning area (Comał, San Marcos, Hueco, Leona, San Antonio, and San Pedro Springs).

Comal Springs: Comal Springs is located in Landa Park, New Braunfels in Comal County. Comal Springs discharges water from the Edwards and associated limestones of the Edwards Aquifer and issues through the Comal Springs Fault. Senate Bill 3 of the 80th Texas Legislature limited the quantity of water that can be withdrawn from the Edwards Aquifer in each calendar year for the period beginning January 1, 2008 to no more than 572,000 acft, specified critical period withdrawal reductions and triggers, and established the Edwards Aquifer Recovery Implementation Program (EARIP) for protection of species listed as threatened or endangered under federal law and associated with the aquifer. As a result of the EARIP, an Habitat Conservation Plan (EAHCP) was published in November 2012 and approved by the U.S. Fish & Wildlife Service in February 2013. Flow protection measures in the EAHCP seek to ensure a minimum monthly average discharge from Comal Springs in excess of 30 cfs in a repeat of the drought of record. Long-term average discharge from Comal Springs is about 290 cfs.

¹² Brune, Gunnar, "Springs of Texas," Volume I, Branch-Smith, Inc., Fort Worth, Texas, 1981.

Hueco Springs: Hueco Springs is located about 3 miles north of New Braunfels near the confluence of Elm Creek and the Guadalupe River in Comal County. There are two main springs issuing from a fault in the Edwards limestone at this location. Sources of water for these springs include the Edwards Aquifer and, possibly, underflow from the Guadalupe River. Long-term average discharge from Hueco Springs is about 40 cfs.

Leona Springs: Leona Springs consists of three groups of springs located from 1 to 6 miles southeast of Uvalde, in Uvalde County. These springs discharge water from the Edwards Aquifer. Long-term average discharge from Leona Springs is about 25 cfs.

San Antonio Springs: San Antonio Springs is located just above East Hildebrand Street in San Antonio, in Bexar County. San Antonio Springs discharge water from the Edwards Aquifer. Long-term average discharge from San Antonio Springs is about 20 cfs.

San Pedro Springs: San Pedro Springs is located in San Pedro Park, San Antonio in Bexar County. San Pedro Springs discharges water from the Edwards Aquifer. Long-term average discharge from San Pedro Springs is about 5 cfs.

1.7.4 Surface Water Quality

Surface water quality within the South Central Texas Region is generally good with typical values for criteria such as total dissolved solids (TDS), chlorides, sulfates, dissolved oxygen, pH, bacteria, and temperature in compliance with applicable Texas Surface Water Quality Standards. Within the South Central Texas Region, these standards are specified for 18 stream segments in the Guadalupe River Basin, 13 stream segments in the San Antonio River Basin, 12 stream segments in the Nueces River Basin, 2 stream segments in the San Antonio – Nueces Coastal Basin, and the Victoria Barge Canal in the Lavaca – Guadalupe Coastal Basin. With the exception of the Victoria Barge Canal, all of these segments support contact recreation and most support domestic water supply. Aquatic life uses are characterized as exceptional in 20 percent of these segments and high in an additional 70 percent of the segments.

Pursuant to Section 303(d) of the federal Clean Water Act, the most recent list of impaired water bodies for which effluent limitations are not stringent enough to implement water quality standards was issued in 2012. This list includes 28 inland water bodies intersecting the South Central Texas Region with 8, 12, 7, and 1 in the Guadalupe, San Antonio, Nueces, and Mission River systems (including tributary segments), respectively. Total Maximum Daily Loads (TMDLs) are being determined for 5 of these bodies, standards are under review for 7, and additional data is needed for 16. The most common impaired parameters are bacteria, dissolved oxygen, and fish community. In addition, Carancahua, Guadalupe, and Mission Bays are currently listed with bacteria as the impaired parameter because oysters occur in these waters.

All water management strategy analyses were performed subject to the assumption that effluent from such water management strategies will be treated at or above the levels in the State Water Quality Management Plan. Additionally, it is assumed that entities comply with the Texas Clean Rivers Program by providing quality-assured data to the Texas Commission on Environmental Quality (TCEQ) and identify and evaluate water quality issues.

Surface water quality characteristics typical of streams and bays in the South Central Texas Region are generally suitable for raw water uses in the industrial, steam-electric power generation, mining, irrigation, and livestock sectors as well as municipal and domestic potable uses after application of conventional treatment methods. Noted impaired water quality parameters in some water bodies does not preclude development of proximate or upstream water management strategies, but does point to the importance of appropriate wastewater treatment, management of non-point source pollutants, and compliance with environmental flow standards.

1.8 Threats to Agricultural and Natural Resources

Pursuant to 31 TAC 357.30, the South Central Texas Regional Water Planning Group (SCTRWPG) has identified the following threats to agriculture in the South Central Texas Regional Water Planning Area:

- A shortage of economically accessible fresh water of suitable quantity and quality for irrigation and for livestock drinking and sanitation purposes. For example, such a shortage could result from groundwater production at insufficiently sustainable rates and/or lack of control over groundwater production.
- Deterioration of water quality, such that the quantities available are not usable for irrigation or livestock drinking and sanitation. Increased salinity is an example of a water quality threat to agriculture.

The SCTRWPG identified the following threats to natural resources in the planning region:

- Reductions of quantity and/or quality of fresh water available to fish and wildlife.
- Changes to aquatic and riparian habitats associated with use of water from streams and aquifers.
- Temporary or permanent inundation of aquatic, riparian, and terrestrial habitats associated with surface water impoundment.

Technical evaluations of water management strategies (Chapter 5) and/or assessments of the cumulative effects of plan implementation (Chapter 6) include quantitative and/or qualitative discussion of how identified threats to agriculture or natural resources are expected to be addressed or affected by a water management strategy and/or the plan. Following is a summary of specific quantitative and/or qualitative measures used to meet this requirement:

- Reliance upon TWDB application of Groundwater Availability Models (GAMs) to illustrate projected changes in regional aquifer levels (Desired Future Conditions) consistent with Modeled Available Groundwater (MAG) estimates, and portray spring discharges and surface water/groundwater interactions at the end of the planning period.
- Comparison of the Gross Business Effects (as provided by the TWDB) associated with failure to meet projected agricultural water needs with the costs of potential water management strategies available to the region.
- Applications of Surface Water Availability Models (WAMs), along with the Flow Regime Application Tool (FRAT) (when necessary), for compliance with TCEQ Environmental Flow Standards in evaluation of proposed new appropriations and quantify projected changes in streamflow and/or freshwater inflows to bays and estuaries. Graphical and tabular summaries of projected changes focus on time series data, monthly medians, and/or frequency of occurrence.
- Qualitative assessment of potential changes in groundwater or surface water quality based on available information.
- Acreage temporarily or permanently inundated by a planned reservoir and the frequency of such inundation.

1.9 Summary of Existing Plans

1.9.1 2012 State Water Plan¹³

In Section 26.051 of the Texas Water Code, the Executive Administrator of the TWDB is charged with producing a State Water Plan that addresses the broad public interest of the State. As currently specified in Sections 16.055 and 16.056, the Plan is to be periodically reviewed and updated and serve as a flexible guide to state policy for the development of its water resources. The TCEQ shall consider the State Water Plan in its water regulatory actions, although its actions are not bound by the Plan.

The 2012 Texas Water Plan provides a statewide perspective that places local and regional needs within the state context. Available individual and county-level studies were built into the overall findings, and in formulating water supply solutions, the Plan focused on economic viability while taking environmental effects into consideration. Legislation, passed in the 75th Legislature, specifies a 5-year update period for the Plan that is based on regional planning studies, and provides that related financial assistance applications must be consistent with the regional and State plans for regulatory approval by State agencies.

¹³ TWDB, State Water Plan: Water for Texas - 2012, Austin, Texas, 2012.

The ultimate goal of the State Water Plan is to identify those policies and actions that may be needed to meet Texas' near- and long-term water needs, based on reasonable projected uses of water, affordable water supply availability, and the goal of conservation of the State's natural resources.

The 2012 State Water Plan includes water management strategies for the South Central Texas Region that could produce new supplies of as much as 765,738 acft in 2060. Selected water management strategies contained in the plan are summarized below:

Three Brackish Groundwater Desalination (Wilcox Aquifer) projects would provide a total of up to 42,220 acft/yr of water in the year 2060 with a capital cost of \$378 million.

Hays/Caldwell Public Utility Agency Project would provide up to 33,314 acft/yr of groundwater (Carrizo Aquifer) in 2060 with a capital cost of \$308 million.

Guadalupe-Blanco River Authority Mid-Basin Project would provide 25,000 acft/yr of Guadalupe run-of-river supplies stored in an off-channel reservoir starting in 2020 with a capital cost of \$547 million.

Off-channel reservoir project (Lower Colorado River Authority/San Antonio Water System) would provide 90,000 acft/yr of water starting in 2030 with a capital cost of \$2 billion.

Recycled Water Programs would provide up to 41,737 acft/yr of water in 2060 with a capita cost of \$465 million.

Seawater Desalination Project would provide 84,012 acft/yr of water in 2060 with a capital cost of \$1.3 billion.

Conservation strategies account for 11 percent of the total amount of water that would be provided by the region's recommended water management strategies.

1.9.2 2011 Regional Water Plan

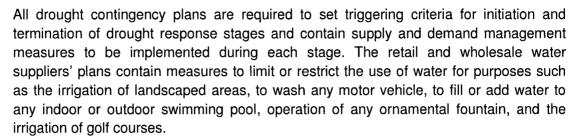

The 2011 South Central Texas Regional Water Plan was adopted in January 2011. The SCT Regional Water Plan, outlines the water management strategies recommended by the planning group to meet the identified needs in the region. These water management strategies are listed in Appendix A.2 of the 2012 State Water Plan.

1.9.3 Local Water Plans

During this planning process the South Central Texas Planning Group worked with each local entity to develop a water management plan to meet any identified needs. These plans are reflected in Chapter 5 of this document.

1.9.4 Current Preparations for Drought

Under requirements of Senate Bill 1 of the 75th Texas Legislature, drought contingency plans are required by the TCEQ for wholesale water providers, irrigation districts, and retail water suppliers. Senate Bill 1 also specifies that TCEQ require surface water right holders that supply 1,000 acft or more of water for non-irrigation use and 10,000 acft/yr for irrigation use prepare a water conservation plan. In addition, conservation plans are commonly included in the management plans of groundwater conservation districts.

The groundwater conservation district management plans also contain conservation plans that set goals and objectives for conserving groundwater within the district. The districts use methods such as requiring wells in areas that are in danger of over producing groundwater and damaging the aquifers to restrict production by means of production permits, metering the amount of water produced, and by working with water utilities, agricultural, and industrial users within the district to promote the efficient use of water.

SAWS' Water Conservation and Reuse Plan aims to reduce the impacts of drought in the San Antonio area of the South Central Texas Region by water conservation programs for its customers. One of the goals of this plan is to increase the public's awareness of water-saving methods, in order to encourage customers to voluntarily conserve water, thus reducing Edwards Aquifer use. Reuse of treated municipal wastewater for landscape irrigation is also a part of the SAWS Conservation and Reuse Plan designed to reduce the use of potable water for non-potable applications.

Senate Bill 3 of the 80th Texas Legislature established critical period management provisions and the Edwards Aquifer Habitat Conservation Plan established flow protection measures to address Edwards Aquifer management and springflow during times of drought. These provisions apply to all holders of regular permits, the customers of all permittees who are retail water utilities, and owners of exempt wells. Under these provisions, during times of drought, water use restrictions and other flow protection measures are engaged, as appropriate and necessary.

The South Central Texas Regional Water Plan relies upon local water management agencies and water utilities drought contingency plans to identify factors specific to each source of water supply to be considered in determining whether to initiate a drought response, and actions to be taken as part of the response. Chapter 7 includes additional information and recommendations of the SCTRWPG regarding drought management. 2016 South Central Texas Regional Water Plan Volume I

1.10 Water Loss Audits

In accordance with 31 TAC 357.30, the South Central Texas 2016 Regional Water Plan includes water loss information compiled by the TWDB from water loss audits performed by retail public utilities of the South Central Texas Regional Water Planning Area pursuant to §358.6 of this title (relating to Water Loss Audits). In addition, in accordance with 31 TAC 357.30, the regional water planning group has considered strategies to address issues identified in the information compiled by the TWDB from the water loss audits performed by retail public utilities pursuant to §358.6 of this title (relating to Water Loss Audits).

The 2010 Water Loss Data presented herein were submitted to the Texas Water Development Board (TWDB) by water utilities in Texas as required by HB 3338 of the 78th Texas Legislature. HB 3338 required the TWDB to compile the information included in the water audits by type of retail public utility and by regional water planning area, and provide that information to the regional planning groups for use in identifying appropriate water management strategies in the development of their regional water plan. The water loss data presented below were acquired as part of the 2010 Water Loss Audit reporting requirements. The methodology used relies upon self-reporting data provided by public utilities, and due to this, the self-reported data may be suspect and in need of further refinement.

The TWDB provided the list of 115 public utilities of the South Central Texas Water Planning Region that filed a water loss audit report. Table 1-11 summarizes a portion of that data for each of the 115 entities. This table shows the total retail population served, total water volume input into the system, total water loss, percent loss, and the value of water loss in dollars.

The cutoff point the TWDB uses for inclusion of a water utility as a Water User Group (WUG) member for which population projections and water demand projections are made for regional planning is 280 acft of deliveries during the first year of the planning period, which in the present case is 2010. Of the 115 public utilities that responded to the water loss survey, 60 reported having delivered less than 280 acft in 2010, and 55 reported having delivered more than 280 acft in 2010.

The 115 water utilities that responded to the water loss survey, reported having served 2,198,808 people in 2010 (about 87 percent of the 2010 regional population) (Table 1-11). Total reported quantity of water produced was 319,179 acre-feet, with a reported quantity of water loss of 50,620 acre-feet (Table 1-11). The quantity of water loss, as a percent of estimated total water originating at the source is calculated at about 15.9 percent (Table 1-11).

1.11 Drought of Record

The historic drought of record for the Guadalupe – San Antonio River Basin of the South Central Texas Region is that which occurred primarily in the 1950s. Although the drought of 2011 was quite severe in terms of combined gaged streamflows for the Guadalupe River at Victoria and the San Antonio River at Goliad, there were three consecutive years in the 1950s drought (1954-1956) during which streamflows in each year were less than those in 2011. Similarly, total Edwards Aquifer recharge in 2011 was twice that for 1956. Focusing on Edwards Aquifer recharge in the Nueces River Basin only, recharge in 2011 was 28 percent greater than that in 1956. Even though the current drought has persisted through the preparation of this plan, moving average analyses of Edwards Aquifer recharge indicate that current drought is less severe than that of the 1950s for durations ranging from 1 to 10 years. Hence, it is appropriate to use the 1950s drought as the drought of record for evaluation of existing supplies and water management strategies in the 2016 South Central Texas Regional Water Plan.

Population and Water Demand Projections [31 TAC §357.31]

In order to develop water plans to meet future water needs, it is necessary to make projections of future population and water demands for the region. For purposes of the South Central Texas Region, the TWDB has made both population and water demand projections for cities, rural areas, and water using purposes for each of the counties of the region (20 full counties and part of Hays County). These counties are located in six major river basins (Nueces, San Antonio, Guadalupe, Colorado, Lavaca, and Rio Grande) and three coastal basins (Colorado-Lavaca, Lavaca-Guadalupe, and San Antonio-Nueces) (see Table 1-1 in Chapter 1). In accordance with TWDB Rules, Section 357.31(e), which states, "In developing regional water plans, regional water planning groups (RWPGs) shall use population and water demand projections developed by the executive administrator that will be contained in the next state water plan and adopted by the TWDB after consultation with the RWPGs, Texas Commission on Environmental Quality (TCEQ), Texas Department of Agriculture (TDA), and the Texas Parks and Wildlife Department (TPWD). The TWDB-approved population and water demand projections are presented in this chapter.

2.1 Population Projections

Based on the population projections provided by the TWDB, the population of the South Central Texas Region is projected increase from 3,001,465 in 2020 to 5,192,028 by 2070 (an increase of 73.0 percent) (Table 2-1 and Figure 2-1). Approximately 68.6 percent of the population of the region is projected to reside in the San Antonio River Basin in the year 2070, with 24.2 percent in the Guadalupe River Basin (Table 2-2).

The TWDB population projections for 181 municipal water user groups (individual cities and water supply districts and/or authorities) and 47 rural areas of each county and part of county of each river basin area of the South Central Texas Region (L) are shown in Appendix A.

2.2 Municipal Water Demand Projections

Municipal water demand is primarily for drinking, bathing, dish and clothes washing, cleaning, sanitation, air conditioning, and landscape watering for residential and commercial establishments and public offices and institutions. Residential and commercial uses are categorized together because they are similar types of uses and they are usually served treated water, of drinking quality, from a common system (e.g., a public water system). The projected quantity of water needed for municipal purposes depends upon the size of the population of the service area, climatic conditions, and water conservation measures. In addition to these factors, per capita water use (gallons per person per day of water use) is a key municipal water planning parameter. Population and per capita water use are used to make projections of municipal water demand for each of the 228 municipal water user groups of the South Central Texas Water Planning Region (Appendix A).

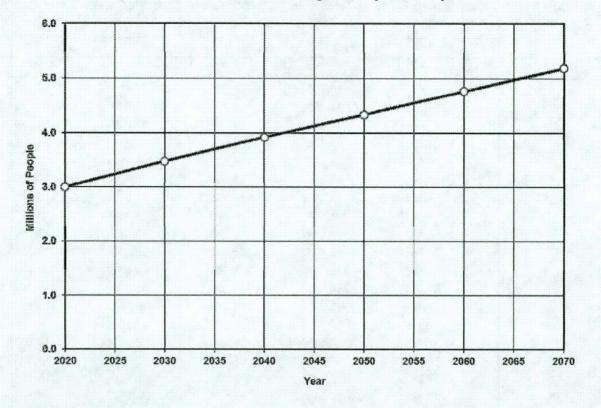

Per capita water use in Region L is projected to decline over the planning period from 140 gallons per capita per day (gpcd) in year 2020 to 130 gpcd in 2070 (Figure 2-2). However, due to projected population growth between 2020 and 2070, municipal water demand in Region L is projected to increase from 469,065 acft/yr in 2020 to 754,306 acft/yr in 2070 (Figure 2-2 and Table 2-2).¹ The projected municipal water demand for each county in the region is shown in Table 2-2. Since Bexar County has the highest population, it also has the largest projected water demand, with almost 59 percent of the total projected municipal water demand for the region by the year 2070 (Table 2-2).

¹ One acre-foot (acft) is 325,851 gallons.

2016 South Central Texas Regional Water Plan Volume I

2.3 Industrial Water Demand Projections

The use of water for the production of goods for domestic and foreign markets varies widely among manufacturing industries in Texas. Manufactured products in Texas range from food and clothing to refined chemical and petroleum products to computers and automobiles. Some processes require direct consumption of water as part of the products being manufactured, while others require very little water consumption, but large volumes of water for cooling or cleaning purposes. Five manufacturing industries account for approximately 90 percent of water used by all manufacturing industries in Texas. These five water-intensive industries are chemical products, petroleum refining, pulp and paper, food and kindred products, and primary metals. The chemical and petroleum refining industries account for nearly 60 percent of Texas annual industrial water use.

Major water using manufacturing sectors in Region L are fabricated metal products, industrial machinery, and food processing. All industries in the region are projected to use 123,983 acft of water in 2020 and 178,820 acft/yr in 2070, a 44 percent increase (Figure 2-3 and Table 2-3). As can be seen in Figure 2-3, manufacturing water demand is projected to increase throughout the planning period.

2.4 Steam-Electric Power Water Demand Projections

Steam-electric power generation in Texas is concentrated in ten privately-owned utilities, which account for 85 percent of generation. Nine percent of power generation occurs in facilities that are both publicly and privately held, and 6 percent is from publicly owned utilities. The industry has faced and will continue to face significant changes in the structure of power generation. These changes range from new technologies to government regulations on the marketing of electricity. These changes may have an impact on how and where power will be generated and the quantities of water needed.

In the generation of steam-electric power, cooling water is circulated through the power plants, with approximately 2 percent being evaporated or consumed, and the remainder being either recirculated or returned to streams. Seven counties (Atascosa, Bexar, Frio, Goliad, Guadalupe, Hays, and Victoria) of the South Central Texas Region have plants that use water in steam-electric power generation. Water demand for steam-electric power generation is projected to be 59,901 acft/yr in 2020 and increase to 152,702 acft/yr by 2070 (a 155 percent increase) (Table 2-4 and Figure 2-3).

2.5 Mining Water Demand Projections

Although the Texas mining industry is a leader in the production of crude petroleum and natural gas in the United States, it also produces a wide variety of important non-fuel minerals. Texas is the only state to produce native asphalt and is the leading producer nationally of Frasch-mined sulfur. It is also one of the leading states in the production of clay, gypsum, lime, salt, stone, and aggregate. In the South Central Texas Region, the principal uses of water for mining are for the extraction of stone, clay, petroleum, natural gas and for sand and gravel washing. Many counties in the South Central Texas Region are part of the Eagleford Shale production area. Water use associated with this area is projected to peak in 2030 and then decline as this area sees less exploration and drilling activity and more production activity which uses less water.

Mining water demands in Region L are projected to be 48,738 acft/yr in 2020 and decrease to 41,209 acft/yr in 2070, a decrease of more than 15 percent (Table 2-5 and Figure 2-3).

Table 2-5 Mining Water Demand Projections South Central Texas Region Individual Counties with River Basin Summaries

In 2020, is it projected that irrigated agriculture will account for approximately 51 percent of the total water used in the state. It is projected that approximately 9.4 million acft of water will be used to grow a variety of crops ranging from food and feed grains to fruits, vegetables, and cotton. Of this 9.4 million acft of water to be used for irrigation in Texas, groundwater will be approximately 70 percent and surface water will be about 30 percent. The TWDB irrigation water demand projections show annual use in the South Central Texas Region to be 344,629 acft/yr in 2020, about 3.7 percent of the total projected irrigation water use in Texas in 2020 (Figure 2-4 and Table 2-6). Projected irrigation water demands in the region in 2070 are 282,760 acft/yr, about 18.0 percent less than those in 2020 (Figure 2-4 and Table 2-6). The projected decline is based upon expected increases in irrigation efficiency and reductions in profitability of irrigated agriculture.

2.7 Livestock Water Demand Projections

In the South Central Texas Region in 2012, livestock production was valued at approximately \$1.1 billion, which was 1.9 times the value of crops produced in the region during that year. There were reported to be approximately 867,500 million head of cattle and calves, 95 million chickens, 38,300 head of sheep and lambs, and about 8,500 hogs and pigs in Region L livestock production in 2012. Although livestock production is an important component of the regional economy, the industry consumes a relatively small amount of water. In 2020, it is projected that water use in the South Central Texas Region for livestock purposes will be 24,038 acft/yr (Figure 2-4 and Table 2-7). It is projected that water used for livestock purposes will remain constant throughout the planning period (Figure 2-4 and Table 2-7).

2.8 Total Water Demand Projections

Total water demand projections for the South Central Texas Region are the sum of water demand projections for municipal, manufacturing, steam-electric power generation, mining, irrigation, and livestock water use sectors (Table 2-2 through Table 2-7) and are summarized in Table 2-8 and Figure 2-5. Total Region L water demands are projected to be 1,070,354 acft/yr in 2020, 1,219,229 acft/yr in 2040, and 1,433,835 acft/yr in 2070 (Table 2-8 and Figure 2-5).

The use sector compositions of projected water demands in Region L are summarized at years 2020, 2040, and 2070 in Table 2-9. As shown in Table 2-9, municipal, manufacturing, and steam-electric percentages of total water demands are expected increase while irrigation, mining, and livestock percentages are expected to increase during the planning period.

Table 2-9 Composition of Projected Water Demands South Central Texas Region 2020, 2040, and 2070

2.9 Water Demand Projections for Counties and River Basins

In accordance with TWDB water planning rules, water demand projections are tabulated by river and coastal basin, county or part of county located within the river or coastal basin, and city, water purveyor, or rural area of each county or part of county for the South Central Texas Region (Appendix A).

2.10 Water Demand Projections for Wholesale Water Providers

The TWDB defines a Wholesale Water Provider (WWP) as any person or entity, including river authorities and irrigation districts, that has contracts to sell more than 1,000 acft of water wholesale in any one year during the five years immediately preceding the adoption of the last regional water plan. Under this definition, the list of WWPs for the South Central Texas Region includes:

- San Antonio Water System (SAWS);
- Guadalupe-Blanco River Authority (GBRA);
- Canyon Regional Water Authority (CRWA);
- Schertz-Sequin Local Government Corporation (SSLGC); and
- Springs Hill WSC (SHWSC).

In addition, the more recently-formed Texas Water Alliance (TWA), Cibolo Valley Local Government Corporation (CVLGC), and Hays-Caldwell Public Utility Agency (HCPUA) are included as WWPs because they are expected to enter into contracts to sell more than 1,000 acft/yr wholesale during the planning period. Tables 2-10 through 2-17 present a combination of current contracts and anticipated contractual demands.

2.10.1 San Antonio Water System

The San Antonio Water System (SAWS) provides part or all of the water supplies for itself and fourteen other utility systems, retail water supplies for most, but not all, of the City of San Antonio, and a portion of the industrial supplies in Bexar County. SAWS is the sole water provider for the Cities of Balcones Heights, Castle Hills, China Grove, Elmendorf, Hill County Village, Hollywood Park, Olmos Park, Somerset, and Terrell Hills and provides part of the water supply for Helotes, Leon Valley, Live Oak, East Central WSC, Von Ormy, and Atascosa Rural WSC. Projected water demands for SAWS are 347,340 acft/yr in 2020, 401,565 acft/yr in 2040, and 487,619 acft/yr in 2070 (Table 2-10).

2.10.2 Guadalupe-Blanco River Authority

The Guadalupe-Blanco River Authority (GBRA) supplies potable and raw water for municipal, industrial, irrigation, and steam-electric purposes through management of run-of-river water rights on the Guadalupe and San Marcos Rivers and storage rights in Canyon Reservoir. As of January 2013, GBRA had contracts to provide water to over 40 public and private entities. Projected demands for present and future GBRA water supply

FJ

customers are 176,378 acft/yr in 2020, 215,591 acft/yr in 2040, and 312,288 acft/yr in 2070 (Table 2-11).

2.10.3 Canyon Regional Water Authority

Canyon Regional Water Authority (CRWA) is a water planning and development agency for water purveyors that serve large areas of Guadalupe County, and portions of Bexar, Caldwell, Hays, Wilson, and Comal Counties. CRWA provides all or part of the water supply for 11 entities: SAWS, Cibolo, County Line WSC, East Central WSC, Green Valley SUD, La Vernia, Marion, Martindale WSC, Springs Hills WSC, Maxwell WSC, and Crystal Clear WSC. The total amounts of water needed by CRWA to meet its customers' projected demands are 25,747 acft/yr in 2020, 28,366 acft/yr in 2040, and 39,678 acft/yr in 2070 (Table 2-12).

2.10.4 Schertz-Seguin Local Government Corporation

The Schertz-Seguin Local Government Corporation (SSLGC) supplies water to the cities of Schertz and Seguin as well as Selma, Springs Hill WSC, Converse, and Universal City. The total amounts of water needed by SSLGC to meet its customers' projected demands are 19,444 acft/yr in 2020, 19,202 acft/yr in 2040, and 22,002 acft/yr in 2070 (Table 2-13).

2.10.5 Springs Hill Water Supply Corporation

Springs Hill WSC provides retail water service within its service area as well as wholesale water to Crystal Clear WSC. A portion of the Springs Hill WSC service area is located inside the City of Seguin. In addition, a portion of the service area is also included in the projected demands for Guadalupe County-Other. The total amounts of water needed by Springs Hill WSC to meet its customers' projected demands are 2,437 acft/yr in 2020, 3,102 acft/yr in 2040, and 5,043 acft/yr in 2070 (Table 2-14).

Texas Water Alliance 2.10.6

The Texas Water Alliance (TWA) is a group of landowners located in northeast Gonzales County organized for the purpose of selling groundwater on a wholesale basis to wholesale water providers (WWPs) and water user groups (WUGs) most likely located in the South Central Texas Regional Water Planning Area (Region L). To date, all of the WUGs listed in Table 2-15, as well as some WWPs (e.g., SAWS, GBRA, and HCPUA), have shown some measure of interest in groundwater supplies potentially available from northeast Gonzales County. Although TWA has obtained groundwater production permits from the Gonzales County Underground Water Conservation District (GCUWCD), it is uncertain at this time which entities will enter into water supply agreements with the TWA and/or other proximate landowners for use of this groundwater. The estimated amounts of water needed by TWA to meet potential customer demands are shown in Table 2-15 and total 4,000 acft/yr in 2020, 6,620 acft/yr in 2040, and 20,000 acft/yr in 2070.

Hays-Caldwell Public Utility Agency 2.10.7

The Hays-Caldwell Public Utility Agency (HCPUA) is comprised of CRWA, Buda, Kyle, and San Marcos and was created for the purposes of sharing water supplies and costs of infrastructure development. The HCPUA was created under Chapter 422 of the Local Government Code General Law in January 2007. Participants in the HCPUA, who are part owners based on an agreed percentage distribution, could take the role(s) of wholesale water distributors and/or retail water purveyors. The estimated amounts of water needed by the HCPUA to meet potential customer demands are shown in Table 2-16 and total 3,182 acft/yr in 2020, 9,125 acft/yr in 2040, and 21,833 acft/yr in 2070.

		Year

2.10.8 Cibolo Valley Local Government Corporation

The Cibolo Valley Local Government Corporation (CVLGC) is a partnership between the Cities of Cibolo and Schertz created to develop more groundwater supplies within the local area. The estimated amounts of water needed by the CVLGC to meet potential customer demands are shown in Table 2-17 and total 0 acft/yr in 2020, 3,441 acft/yr in 2040, and 10,000 acft/yr in 2070.

3 Water Supply Analyses [31 TAC §357.32]

3.1 Groundwater Supplies

There are five major and six minor aquifers supplying water to the South Central Texas Region. The five major aquifers are the Edwards-Balcones Fault Zone (including the Barton Springs Segment), Carrizo-Wilcox¹, Trinity, Gulf Coast, and Edwards-Trinity (Plateau) Aquifers (Figure 3-1). The six minor aquifers are the Austin Chalk, Buda Limestone, Leona Gravel, Sparta, Queen City, and Yegua-Jackson Aquifers. Chapter 1.7.1 includes more detailed descriptions of the aquifers, including water quality characteristics.

Figure 3-1 Major Aquifers — South Central Texas Region

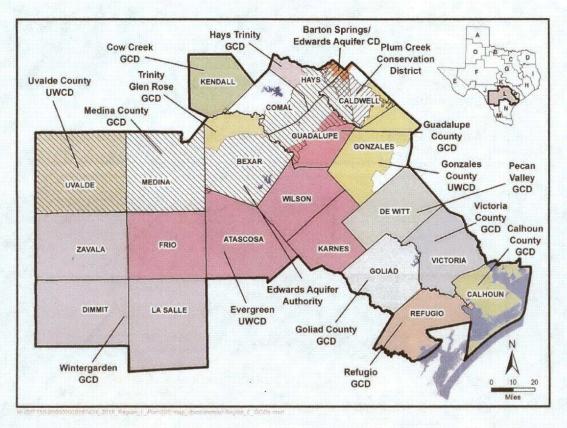

There are 17 groundwater conservation districts (GCDs) in the South Central Texas Region (Figure 3-2). A GCD serves all or a portion of each county in the region. The responsibilities and authorities of these GCDs vary depending upon creating legislation and governing law, and some districts are not responsible for all aquifers within the geographic boundaries of the district. For example, the statutory district of the Edwards

¹ Although traditionally identified by the Texas Water Development Board as one major aquifer, the Carrizo and Wilcox formations are generally separated by an aquitard which serves to limit hydraulic connectivity between the two formations in some portions of the planning region.

Aquifer Authority (EAA) includes (among others) Bexar, Medina, and Uvalde Counties, but the EAA exercises permitting authority only with respect to the Edwards Aquifer in those counties. Other aquifers within this three-county area are managed by the Trinity-Glen Rose GCD, Medina County GCD, and the Uvalde County Underground Water Conservation District. The Carrizo-Wilcox Aquifer in Bexar County, however, is not managed by a GCD.

Figure 3-2 Groundwater Conservation Districts

3.1.1 Groundwater Availability

TWDB General Guidelines for Regional Water Plan Development offer the following with regard to evaluation of groundwater availability:

"Groundwater availability shall be based on the Modeled Available Groundwater (MAG) volumes that may be produced on an average annual basis to achieve Desired Future Conditions (DFCs) as adopted by Groundwater Management Areas (GMAs)."

Groundwater is regulated locally by groundwater conservation districts except in locations that do not have a district. In areas that do not have a district, including Priority Groundwater Management Areas, water availability may be set by a county commissioners court pursuant to TWC §35.109, however, the South Central Texas Regional Water Planning Group did not receive any such information from a commissioners court.

Districts may issue permits that regulate pumping of groundwater and spacing of wells within their jurisdictions. Multiple districts within a single GMA determine the DFCs of relevant aquifers within that area. DFCs are the desired, quantified conditions of groundwater resources, such as water levels, water quality, spring flows, or volumes at a specified time or times in the future or in perpetuity. TWDB staff has translated DFCs into MAG volumes using approved Groundwater Availability Models (GAMs) (or other approaches if a GAM is not applicable). A MAG volume is the amount of groundwater production, on an average annual basis, that will achieve a DFC. The DFC in a specific location may not be achieved if groundwater production exceeds the MAG volume over the long term.

Therefore, in the regional water planning process, total anticipated groundwater production in any planning decade may not exceed the MAG volume in any countyaquifer location (total groundwater production includes quantities associated with both existing supplies and any recommended water management strategies). This prevents regional water planning groups from recommending water management strategies with supply volumes that would result in exceeding (i.e. "overdrafting") approved MAG volumes. Table 3-1 provides a summary of information pertinent to groundwater availability, existing supply, and permits by county, GCD, and aquifer for all major aquifers in Region L with the exception of the Edwards. In the rightmost column of Table 3-1, the remaining groundwater after accounting for the greater of permits issued or existing supplies is shown for 2070. This is the volume of groundwater that could be used for Water Management Strategies. With respect to municipal utilities, it is important to note that the existing supplies, after generally accounting for the ratio of peak to average day water demands, are equal to the lesser of the tested well capacities as reported to the Texas Commission on Environmental Quality (TCEQ) or the MAG as calculated by the TWDB. Existing supplies are not necessarily representative of current or projected groundwater use.

In the case of the Edwards Aguifer, Senate Bill 3 of the 80th Texas Legislature requires the EAA to cooperatively develop a Recovery Implementation Program (RIP) through a facilitated, consensus-based process that involves input from the USFWS, other appropriate federal agencies, and all interested stakeholders, including those listed under Section 1.26A(e)(1) of the EAA Act. SB 3 further directed the EAA and other state agencies to participate in the EARIP and to jointly prepare, along with other stakeholders, a "program document that may be in the form of a habitat conservation plan (HCP) used in the issuance of an incidental take permit." The HCP is required to provide recommendations for withdrawal adjustments based on a combination of spring discharge rates of the San Marcos and Comal Springs and levels at the J-17 and J-27 index wells during critical periods to ensure that federally listed, threatened, and endangered species associated with the Aquifer will be protected at all times, including throughout a repeat of the drought of record. The approved HCP includes four components which affect water supply from the Edwards Aquifer: 1) the Voluntary Irrigation Suspension Program Option (VISPO); 2) additional municipal conservation measures; 3) SAWS ASR tradeoff; and 4) emergency Stage V critical period reductions.² For water supply planning purposes in the 2016 South Central Texas Regional Water

² RECON Environmental, Inc., et al., "Edwards Aquifer Recovery Implementation Program – Habitat Conservation Plan," December 2011.

Plan, the EAHCP Workgroup recommended and the regional water planning group approved the assumption that existing supplies from the Edwards Aquifer would be based on full implementation of the HCP. This produces a total supply from the EAA portion of the Edwards Aquifer of about 293,000 acft/yr including estimated exempt federal and domestic and livestock production.

Projected groundwater supplies available in the South Central Texas Region under drought of record conditions are 970,213 acft/yr in 2020, 986,136 acft/yr in 2040, and 989,028 acft/yr in 2070 (Table 3-2). Supplies from most aquifers are projected to hold steady on an annual basis throughout the 2020 to 2070 projection period. The supply available from the Carrizo-Wilcox Aquifer is projected to increase from 379,026 acft/yr in 2020 to 399,733 acft/yr in 2070. The supplies available from the Gulf Coast, Sparta, and Queen City Aquifers are projected to decline slightly over the 2020 to 2070 projection period.

3.1.2 Assumptions for Assessment of Groundwater Supply

1. Groundwater availability by county is subdivided into river basin parts of each county according to data supplied by the TWDB. Groundwater supplies for municipal utilities relying on non-Edwards aquifers are based upon well capacities obtained from the TCEQ Water Utility Database.

2. Groundwater availability during drought of record conditions from the EAA portion of the Edwards Aquifer is set at a total of 293,053 acft/yr. Initial regular permit amounts from the EAA as of March 22, 2013 are prorated down in accordance with EAA rules and implementation of the EAHCP to achieve a total value of 293,053 acft/yr as the sum of all existing supplies, including exempt domestic and federal uses.

3. Municipal supplies from all Aquifers except the EAA portion of the Edwards Aquifer are generally estimated as follows:

a. For cities using groundwater, supply is based on reported well capacities with adjustments to account for a peak to average day water demand ratio of 2:1. In cases in which the total demand on that portion (i.e., county and river basin) of the aquifer exceeds the total availability, supply is prorated downwards for every entity using that particular source.

b. For rural areas, it is assumed that the rural household (municipal) demand would be met from aquifers underlying that river basin portion of the county. The rural supply is generally set to at least the maximum demand during the planning period. In cases in which the total demand on that portion (i.e., county and river basin) of the aquifer exceeds the total availability, supply is prorated downwards for every entity using that particular source.

4. Industrial supply from groundwater (except for the EAA portion of the Edwards Aquifer) is associated with aquifers underlying the river basin portion of the county. The industrial supply is generally set equal to the maximum industrial groundwater pumpage over the 2007 to 2011 time period; however, some adjustments were made to some counties. In cases in which the total demand on that portion (i.e. county & river basin) of the aquifer exceeds the total availability, supply is prorated downwards for every entity using that particular source.

5. Steam-electric supply from groundwater (except for the EAA portion of the Edwards Aquifer) is associated with aquifers underlying the river basin portion of the county. The steam-electric supply is generally set equal to the maximum industrial groundwater pumpage over the 2007 to 2011 timer period; however, some adjustments were made to some counties. In cases in which the total demand on that portion (i.e., county and river basin) of the aquifer exceeds the total availability, supply is prorated downwards for every entity using that particular source.

6. Irrigation supply from groundwater (except from the EAA portion of the Edwards Aquifer) is associated with aquifers underlying the river basin portion of the county. The irrigation supply is generally calculated as being equal to the projected demand in each decade; however, in some cases, this value is adjusted due to supplied pumpage data. In cases in which the total demand on that portion (i.e., county and river basin) of the aquifer exceeds the total availability, supply is prorated downwards for every entity using that particular source.

7. Mining supply from groundwater (except from the EAA portion of the Edwards Aquifer) is associated with aquifers underlying the river basin portion of the county. The mining supply is calculated as being equal to the projected demand in each decade; however, in some cases, this value is adjusted due to supplied pumpage data. In cases in which the total demand on that portion (i.e., county and river basin) of the aquifer exceeds the total availability, supply is prorated downwards for every entity using that particular source.

8. For all areas within the planning region, livestock water demand is generally assumed to be met 50 percent from quantified groundwater sources and 50 percent from local surface water and unquantified groundwater sources such as stock tanks, streams, and windmills. Livestock water supply is set equal to projected livestock demand.

Table 3-1 Available Groundwater Supply for the Gulf Coast, Carrizo-Wilcox,Trinity, and Edwards Trinity Aquifers

County	Aquifer	GCD	2070 Modeled Available Groundwater (MAG) Volume (acft/yr)	2070 Existing Supply (acft/yr)	Availability Remaining for WMS (acft/yr)

Table 3-2 Available Groundwater Supply by Aquifer

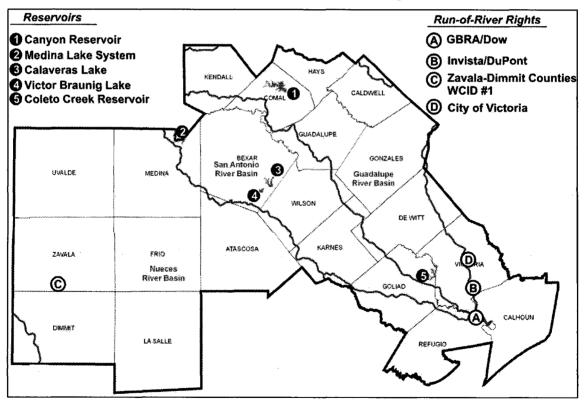

December 2015 | 3-7

3.2 Surface Water Supplies

The South Central Texas Regional Water Planning Area (Region L) includes parts of the Rio Grande, Nueces, San Antonio, Guadalupe, Colorado, and Lavaca River Basins, and parts of the Colorado-Lavaca, Lavaca-Guadalupe, and San Antonio-Nueces Coastal Basins. As indicated in Figure 3-3, however, the Nueces, San Antonio, and Guadalupe are the major river basins of interest in considering Region L surface water supplies. Although the Guadalupe and San Antonio River Basins have been delineated as separate river basins, the two rivers join prior to discharge into San Antonio Bay. In part because of the large concentration of senior water rights below the confluence of the two rivers, the two river basins are considered as one (i.e. the Guadalupe-San Antonio River Basin) when evaluating surface water supplies available under existing water rights. All of the major reservoirs within Region L are located in the Guadalupe-San Antonio River Basin and are identified in Figure 3-3. Owners and locations of major run-of-river rights having authorized annual consumptive use in excess of 10,000 acft/yr are also shown in Figure 3-3. Major reservoirs and run-of-river water rights are discussed in the following subsections.

Figure 3-3 Major River Basins, Reservoirs, and Run-of-River Rights

3.2.1 Major Reservoirs and Associated Water Rights

Major reservoirs and associated water rights within the South Central Texas Region are summarized in Table 3-3. The firm yield, or dependable supply of water available during a repeat of the drought of record, for each of these reservoirs is also listed in Table 3-3. Additional information regarding each of the major reservoirs is provided in the following paragraphs.

The Medina Lake System is located on the Medina River, a tributary of the San Antonio River, in Medina and Bandera Counties. The Medina Lake System is owned by the Bexar-Medina-Atascosa Counties Water Control and Improvement District No. 1 (BMA) and has traditionally been used to supply irrigation water to farms in Bexar, Medina, and Atascosa Counties via the Medina Canal System. The San Antonio Water System (SAWS) has contracts with BMA to obtain municipal water supplies from the Medina Lake System which are delivered via the bed and banks of the Medina River to a point of diversion near Von Ormy in southwestern Bexar County. The Medina Lake System is unique among the major reservoirs in the South Central Texas Region because waters impounded therein contribute recharge, estimated to average over 42,000 acft/yr,³ to the Edwards Aguifer. Because of surface water "losses" to recharge and special conditions within Certificate of Adjudication #19-2130, as amended, it has been determined that the firm yield of the Medina Lake System in a repeat of the drought of record is essentially zero. Hence, the Medina Lake System has not been included as an existing source of surface water supply in Region L. Because of its location on the boundary of Regions L and J, the TWDB has designated the Medina Lake System as a special water resource. As Region L is not relying upon the Medina Lake System as a source of supply during drought, it is assumed that there are no conflicts with any water supply contracts or option agreements held by entities in the Plateau Region. It is further assumed that interests upstream of Medina Lake will obtain the necessary water rights permit(s) for diversion from the Medina River and/or its tributaries and will mitigate any associated impacts upon recharge of the Edwards Aguifer within Region L.

Braunig and Calaveras Lakes, owned by the CPS Energy, are located in the San Antonio River Basin in Bexar County to the southeast of San Antonio and are used for steamelectric power plant cooling water. Runoff from the watersheds above the reservoirs and diversions from the San Antonio River (including treated effluent discharged by the San Antonio Water System) are used to maintain necessary lake levels to facilitate efficient power plant operations.

Constructed by the U.S. Army Corps of Engineers, Canyon Reservoir is located in the Guadalupe River Basin in Comal County on the mainstem of the Guadalupe River. Uses of the reservoir include water supply for municipal, industrial, steam-electric power generation, irrigation, and hydroelectric power generation, as well as flood protection and recreation. Diversions from Canyon Reservoir are currently authorized up to an average of 90,000 acft/yr. Water supplies from Canyon Reservoir are managed by the Guadalupe-Blanco River Authority (GBRA) and made available to customers both within their ten-county district and in adjacent counties and/or river basins. Because a portion of its watershed is located in the Plateau Region (J), the TWDB has designated Canyon Reservoir as a special water resource. The South Central Texas Region (L) has included existing contracts between GBRA and entities in the Plateau Region in its assessments of surface water supplies using the Guadalupe-San Antonio River Basin Water Availability Model (GSA WAM). Pursuant to a Memorandum of Understanding (MOU) between GBRA and the Commissioners' Court of Kerr County, the SCTRWPG recognizes a potential commitment of approximately 2,000 acft/yr from the firm yield of Canyon Reservoir for the calendar years 2021 through 2060. GBRA's hydrology studies

³ HDR Engineering, Inc. (HDR), "Edwards Aquifer Recharge Analyses," Trans-Texas Water Program, West Central Study Area, Phase II, Texas Water Development Board, San Antonio River Authority, et al., March 1998.

have indicated that a commitment of about 2,000 acft/yr would be necessary to allow permits for 6,000 acft/yr to be issued by TCEQ for diversion in Kerr County. No additional supplies from Canyon Reservoir are specifically reserved for entities within the Plateau Regional Water Planning Area (Region J) at this time. The SCTRWPG also recognizes commitments of about 600 acft/yr and 1,680 acft/yr from Canyon Reservoir to meet projected needs for the Cities of Blanco and Buda, respectively, located in the Lower Colorado Regional Water Planning Area (Region K).

Coleto Creek Reservoir, owned by Coleto Creek Power (part of GDF SUEZ Energy North America) and operated by GBRA, is located at the border of Victoria and Goliad Counties in the lower Guadalupe River Basin, and is a cooling reservoir for steam-electric power generation. Sources of water include runoff from the Coleto Creek watershed and diversions from the Guadalupe River, backed by stored water from Canyon Reservoir, when needed. The reservoir supplies water for steam-electric power generation at the Coleto Creek Power Station located in Goliad County.

Lakes Dunlap, McQueeny, Placid, Nolte, Gonzales, and Wood, on the Guadalupe River between New Braunfels and Gonzales, form pools for hydroelectric power generation and are the sites of hydroelectric power plants providing service to the Guadalupe Valley Electric Cooperative. These reservoirs and water rights are owned by GBRA. In addition to those owned by GBRA, there are other small reservoirs and associated priority and non-priority water rights for hydroelectric power generation located along the Guadalupe River at Seguin, Gonzales, and Cuero. Since hydroelectric power generation is a nonconsumptive use of water, water available to these rights is not listed in Table 3-3. All water rights are, however, included on a priority basis in the assessment of surface water supply using the GSA WAM.

Reservoir	Water Right Owner	Certificate of Adjudication Number	Authorized Diversion (acft/yr)	Firm Yield (acft/yr)	Purposes
San Antonio River Bas	in		·		
Medina Lake System	Bexar-Medina-Atascosa Counties WCID #1	19-2130	66,750	0 ²	Irrigation, municipal, domestic, livestock
Victor Braunig Lake	City Public Service Board of San Antonio	19-2161	12,000 ³	>12,0004	Steam-electric power
Calaveras Lake	City Public Service Board of San Antonio	19-2162	37,000 ⁵	>37,0004	Steam-electric power generation
Guadalupe River Basin			<u></u>		
Canyon Reservoir	Guadalupe-Blanco River Authority	18-2074	90,000 ⁶	~90,000 ⁶	Municipal, industrial, steam- electric, hydropower, irrigation, flood protection
Coleto Creek Reservoir	Coleto Creek Power	18-5486	24,160 ⁷	>24,1604	Steam-electric power generation

² Includes rights to divert up to 12,000 acft/yr from the San Antonio River to Braunig Lake and to consume up to 12,000 acft/yr at Braunig Lake.

³ The reservoir and supplemental authorized diversions from the adjacent river could support a firm yield in excess of the authorized consumptive use, however, operations of steam-electric power generation facilities could be impaired.

⁴ Includes rights to divert up to 60,000 acft/yr of the unappropriated public waters of the San Antonio River including treated effluent to Calaveras Lake and to consume up to 37,000 acft/yr.

The firm yield of Canyon Reservoir is dependent upon a number of factors including points of diversion for contracted supplies, Edwards Aquifer springflow, term recreational flow agreements, and discharge of treated effluent throughout the Guadalupe – San Antonio River Basin. Subject to the hydrologic assumptions and operational procedures listed in Section 3.2.3.1, estimates of Canyon Reservoir firm yield range from 89,100 acft/yr to 88,400 acft/yr in years 2020 and 2070, respectively.

Includes rights to divert up to 20,000 acft/yr from the Guadalupe River to Coleto Creek Reservoir and to consume up to 24,160 acft/yr.

3.2.2 Run-of-River Water Rights

In addition to those associated with major reservoirs, surface water rights have been issued by the TCEQ and predecessor agencies to individuals, cities, industries, and water districts and authorities for diversion from flowing streams of the South Central Texas Region. Each right bears a priority date, diversion location, maximum diversion rate, and annual quantity of diversion. Some rights may include off-channel storage authorization, instream flow restrictions, and various special conditions. The principle of prior appropriation or "first-in-time-first-in-right" is applied, which means that the most senior, or oldest, right has first call on flows, with the second, third, and more recent rights having second, third, and later priorities for diversions. This procedure gives senior right holders priority when streamflows are low, as in periods of drought, and renders junior rights less reliable during droughts. The most junior water right holders may not be able to divert any water during severe droughts if so directed by the TCEQ acting through the South Texas Watermaster.

It is important to note that many run-of-river rights are for irrigation purposes, where chances are taken at planting time upon whether or not water will be available for crop production during the growing season. In fact, when reviewing applications for irrigation rights, TCEQ staff has traditionally considered whether 75 percent of the proposed diversion would be available in 75 percent of the years. Municipal, industrial, and steam-electric power users, however, typically require more reliable supplies than are available from run-of-river flows. Hence, these types of users will often develop storage and/or alternative supplies to increase the reliability of their run-of-river rights.

For the Nueces River Basin part of the South Central Texas Region, run-of-river water rights total more than 120,000 acft/yr and are primarily used for irrigation purposes. Consumptive run-of-river rights in the Guadalupe-San Antonio River Basin total over 446,000 acft/yr and are used primarily for irrigation, municipal, and industrial purposes.

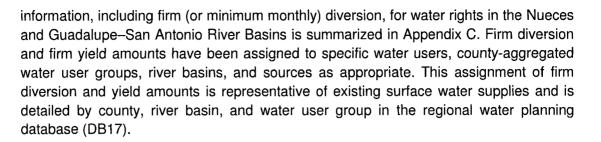

3.2.3 Surface Water Availability

Surface water supplies for the vast majority of the South Central Texas Region have been quantified using the Nueces and Guadalupe-San Antonio River Basin Water Availability Models (WAMs).^{4,5} These WAMs were originally developed under a contract with the TCEQ. Supplemental daily time-step computational procedures (e.g., the Flow Regime Application Tool aka. FRAT) have also been used to quantify water availability for new appropriations associated with potentially feasible water management strategies subject to TCEQ environmental flow standards.

Surface water supply analyses for the South Central Texas Region have been completed using the WAMs to quantify the firm diversion associated with run-of-river water rights, calculate the firm yields associated with Canyon Reservoir and the Medina Lake System, and ensure the reliability of authorized consumptive uses associated with steam-electric power generation at major reservoirs. These analyses were performed subject to specific hydrologic assumptions and operational procedures adopted by the SCTRWPG and approved by the TWDB for the assessment of surface water supply. Reliability

⁴ HDR, 'Water Availability in the Guadalupe-San Antonio River Basin," Texas Natural Resource Conservation Commission (TNRCC), December 1999.

⁵ HDR, "Water Availability in the Nueces River Basin," TNRCC, October 1999.

Hydrologic Assumptions and Operational Procedures for Assessment of Surface Water Supply

- 1. Full exercise of surface water rights.
- Edwards Aquifer withdrawals, critical period management, and resulting springflows for the 1947-1989 period consistent with the Edwards Aquifer Habitat Conservation Plan approved by the U.S. Fish & Wildlife Service and developed through the Edwards Aquifer Recovery Implementation Program.
- 3. Operation of Canyon Reservoir at firm yield in accordance with Certificate of Adjudication No. 18-2074E, including subordination of all senior Guadalupe River hydropower permits to Canyon Reservoir.
- 4. Delivery of GBRA's present contractual obligations from Canyon Reservoir to points of diversion.
- 5. Effluent discharge / return flow in the Guadalupe San Antonio River Basin is that reported for 2006, adjusted for current SAWS direct recycled water commitments. Smaller reuse commitments of San Marcos, New Braunfels, Seguin, Kyle, San Antonio River Authority, and Cibolo Creek Municipal Authority are considered to the extent data was readily available.
- 6. Operation of power plant reservoirs (Braunig, Calaveras, and Coleto Creek) subject to authorized consumptive uses at the reservoir, with makeup diversions as needed to maintain full conservation storage to the extent possible subject to senior water rights, instream flow constraints, and/or applicable contractual provisions.
- 7. Operation of Choke Canyon Reservoir/Lake Corpus Christi (CCR/LCC) System at safe yield subject to the TCEQ Agreed Order regarding freshwater inflows to the Nueces Estuary.
- 8. Period of record for simulations: Guadalupe-San Antonio River Basin (1934-1989, Critical Drought = 1950s) and Nueces River Basin (1934-1997, Critical Drought = 1990s).

3.3 Reuse Supplies

Current water supplies in the South Central Texas Region involving reuse of treated wastewater are associated with the Recycled Water Program of the San Antonio Water System (SAWS) and contractual commitments by the Guadalupe-Blanco River Authority (GBRA), City of San Marcos, and others. In Bexar County, 560 acft/yr of reuse water has been included as a supply for Fair Oaks Ranch, 4,076 acft/yr has been included as a supply to industrial uses, and 6,776 acft/yr has been assigned to SAWS to non-industrial uses. A reuse supply of 107 acft/yr from the City of New Braunfels has been included as a reuse supply in Comal County. A reuse supply of 1,413 acft/yr (629 acft/yr from

2016 South Central Texas Regional Water Plan Volume I

Seguin and 784 acft/yr from GBRA) has been included as a supply in Guadalupe County. A reuse supply of 4,119 acft/yr (199 acft/yr from Kyle, 3,696 acft/yr from San Marcos, and 224 acft/yr from Wimberley) has been included as a supply in Hays County. A reuse supply of 30 acft/yr from the City of Kenedy has been included as a supply in Karnes County. Finally, a reuse supply of 271 acft/yr (230 acft/yr from Kendall County WCID #1, 34 acft/yr from GBRA, and 7 acft/yr from the City of Boerne) has been included as a supply source in Kendall County.

Chapter 4

4 Identification of Water Needs [31 TAC §357.33]

4.1 Water Needs Projections by Water User Group

In this chapter, the demand projections from Chapter 2 and the supply projections from Chapter 3 are compared to identify and estimate projected water needs in the South Central Texas Region through the year 2070. If projected demands exceed projected supplies for a water user group, the difference or shortage, is identified as a water need for that water user group. As a recap, Chapter 2 presents demand projections for six types of water use: municipal, industrial, steam-electric, mining, irrigation, and livestock. These projections are intended to be representative of dry-year demands. Municipal water demand projections are shown for each entity that supplied more than 280 acft of water in the year 2010, and for the County-Other category in each county. Chapter 3 presents estimates of surface water availability (i.e. firm yield for reservoirs and firm diversions for run-of-river supplies) and Modeled Available Groundwater.

This chapter provides summaries of the water needs (shortages) for each Water User Group (WUG) located in the South Central Texas Region. Table 4-1 provides a summary of projected water needs for each WUG in the planning area by county. If a WUG provides service in multiple counties, it is listed only in its "primary" county in Table 4-1. Table 4-2 lists WUGs that provide service in multiple counties and the "primary" county to which that WUG has been assigned for presentation herein. Region L has a projected annual water need of 200,071 acft in 2020, increasing to 482,943 acft by 2070 (Table 4-1, end of table).

4.1.1 Municipal WUGs with Needs

There are 60 municipal WUGs with a projected need (shortage) between 2020 and 2070. The total municipal need for the region in 2020 is 72,636 acft/yr, increasing to 304,164 acft/yr in 2070 (Table 4-1). Sixteen counties (Atascosa, Bexar, Caldwell, Comal, Dimmit, Frio, Gonzales, Guadalupe, Hays, Karnes, Kendall, La Salle, Medina, Uvalde, Victoria, and Wilson) are projected to have at least one WUG with a municipal need (shortage) during the planning period, as shown in Figure 4-1.

4.1.2 Industrial WUGs with Needs

The total industrial need for the region in 2020 is 6,308 acft/yr, increasing to 40,034 acft/yr in 2070 (Table 4-1). Five counties (Bexar, Calhoun, Comal, Guadalupe, and Victoria) are projected to have an industrial need (shortage) during the planning period, as shown in Figure 4-2.

4.1.3 Steam-Electric WUGs with Needs

The total steam-electric need for the region in 2020 is 4,506 acft/yr, increasing to 70,696 acft/yr in 2070 (Table 4-1). One county (Victoria) is projected to have a steam-electric need (shortage) during the planning period, as shown in Figure 4-3.

4.1.4 Mining WUGs with Needs

The total mining need for the region in 2020 is 10,822 acft/yr, decreasing to 666 acft/yr in 2070 (Table 4-1). Four counties (DeWitt, Dimmit, Karnes, and La Salle) are projected to have a mining need (shortage) during the planning period, as shown in Figure 4-4.

4.1.5 Irrigation WUGs with Needs

The total irrigation need for the region in 2020 is 105,799 acft/yr, decreasing to 67,383 acft/yr in 2070 (Table 4-1). Eight counties (Bexar, Calhoun, DeWitt, Dimmit, Medina, Uvalde, Victoria, and Zavala) are projected to have an irrigation need (shortage) during the planning period, as shown in Figure 4-5.

4.1.6 Livestock WUGs with Needs

There are no projected livestock needs within the planning period.

Figure 4-5 Irrigation Water Needs

4.2 Water Needs Projections by Wholesale Water Provider

A summary of projected water demands, existing supplies, and needs (shortages) for each Wholesale Water Provider (WWP) in the South Central Texas planning region is provided in Table 4-3. Projected water demands for each WWP are estimated on the basis of existing and/or future contracts with water user groups (WUGs) expected to continue receiving water or acquire new water supplies from the WWP. Supplies for each WWP are determined in accordance with procedures and assumptions described in Chapter 3 and are identified by source in Table 4-3. The Texas Water Alliance, San Antonio Water System (SAWS), Cibolo Valley Local Government Corporation (CVLGC), Hays-Caldwell Public Utility Agency (HCPUA), Guadalupe-Blanco **River** Authority (GBRA), Canyon Regional Water Authority (CRWA), and Schertz-Seguin Local Government Corporation (SSLGC) each have projected needs for additional water supply throughout the planning period. The Springs Hill WSC (SHWSC), on the other hand, has existing supplies in excess of projected demands throughout the planning period. These existing supplies in excess of projected demand are identified in Table 4-3 as System Management Supplies.

5.1 Recommended Water Management Strategy Descriptions

[31 TAC §357.34]

A brief description of each of the recommended water management strategies included in the 2016 South Central Texas Regional Water Plan is provided in Chapter 5.1. Descriptions include the dependable (firm) water supply during drought and an estimated annual unit cost (in September 2013 dollars) for water at full operating capacity during the debt service period (if applicable).

5.1.1 Municipal Water Conservation

The Municipal Water Conservation water management strategy includes conservation practices and programs to reduce per capita water use in cities by amounts in addition to reductions already incorporated into the Texas Water Development Board (TWDB) water demand projections. The SCTRWPG established municipal water conservation goals as follows:

- For municipal Water User Groups (WUGs) with water use of 140 gpcd and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 gpcd is reached, after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period; and
- For municipal WUGs having year 2000 water use of less than 140 gpcd, the goal is to reduce per capita water use by one-fourth percent per year (0.25% per year).

Best Management Practices (BMPs) for water conservation, as identified by the Water Conservation Implementation Task Force, are recommended as means of achieving these municipal water conservation goals. The objective of municipal water conservation programs is to reduce the per capita water use without adversely affecting the quality of life of the people involved. Planned municipal water conservation focuses on the following specific BMPs:

- Use of low flow plumbing fixtures (e.g., toilets, shower heads, and faucets that are designed for low quantities of flow per unit of use);
- The selection and use of more efficient water-using appliances (e.g., clothes washers and dishwashers);
- Modifying and/or installing lawn and landscaping systems to use grass and plants that require less water;
- · Repair of plumbing and water-using appliances to reduce leaks; and
- Modification of personal behavior that controls the use of plumbing fixtures, appliances, and lawn watering methods.

The SCTRWPG recognizes that meeting the water conservation goals through implementation of these, or other, BMPs represents the highest practicable level of water conservation pursuant to 31 TAC 357.34(f)(2)(C). Planned additional municipal water conservation focused on these BMPs could effectively increase supply through demand

reduction in the South Central Texas Region by 96,288 acft/yr in the year 2070 at unit costs ranging from \$681 per acft/yr to \$770 per acft/yr. Volume II, Chapter 5.2.1 includes a detailed discussion of this water management strategy.

5.1.2 Drought Management

The TWDB has adopted the SCTRWPG's general methodology for estimating the economic impacts associated with implementation of drought management as a water management strategy. Application of this methodology for regional water planning purposes has facilitated comparison of drought management to other potentially feasible water management strategies on a unit cost basis (Chapter 5.2.2). The SCTRWPG has found, and the San Antonio Water System (SAWS) has demonstrated, that water user groups having sufficient flexibility to focus on discretionary outdoor water use first and avoid water use reductions in the commercial and manufacturing use sectors may find some degrees of drought management to be economically viable and cost-competitive with other water management strategies. Recognizing that implementation of appropriate water management strategies is a matter of local choice, the SCTRWPG recommends due consideration of economically viable drought management as an interim strategy to meet near-term needs through demand reduction until such time as economically viable long-term water supplies can be developed. Hence, new demand reductions associated with the 5 percent drought management scenario are shown at year 2020 for each municipal water user group with projected needs for additional water supply at year 2020. A total demand reduction of 2,839 acft/yr in 2020 was calculated for 28 WUGs at an average unit cost of \$1,431/acft/yr. Volume II, Chapter 5.2.2 includes a detailed discussion of this recommended water management strategy.

5.1.3 Facilities Expansions

Several WUGs are interested in projects to expand major components of their existing infrastructure (facilities) so they can continue to provide a safe and reliable water supply to their customers during the planning period. These facilities expansions are considered to be independent of any potential water management strategies to acquire a new water supply, and instead are intended to address expected future improvements to the water system, such as the installation of new water transmission facilities or additional water treatment. Volume II, Chapter 5.2.3 summarizes the expansions associated with this recommended water management strategy. Eleven facilities expansion projects are identified for nine entities. The capacities of the projects range from 672 acft/yr to 84,000 acft/yr.

5.1.4 Direct Recycled Water Programs

The Direct Recycled Water Programs water management strategy involves direct reuse of reclaimed municipal wastewater for non-potable uses such as irrigation of golf courses, parks, and open spaces of cities, landscape watering of large office and business complexes, cooling of large office and business complexes, steam-electric power plant cooling, process or wash water for mining operations, irrigation of farms that produce livestock feed and forage, irrigation of farms that produce sod, ornamentals, and landscape plants, and for instream uses such as riverwalks and waterways. This strategy is being planned within the region by entities including SAWS, SARA, CCMA, New Braunfels Utilities, the City of Kyle, and the City of San Marcos and can be expanded as the quantities of municipal wastewater increase with population growth. By 2070, the participating entities are projected to directly reuse 97,763 acft/yr of treated wastewater at unit costs ranging from \$458/acft/yr to \$1,500/acft/yr. An advantage of this strategy is that the water has already been developed and brought to the locations of many of the uses listed above. Volume II, Chapter 5.2.4 includes a detailed discussion of this recommended water management strategy.

5.1.5 Edwards Aquifer Habitat Conservation Plan

The Edwards Aquifer Habitat Conservation Plan (EAHCP) is identified as both an existing supply and a water management strategy in the 2016 SCTRWP. It is an existing supply in that the existing supply for users of the Edwards Aquifer is calculated assuming full implementation of the EAHCP. Likewise, springflows consistent with full implementation of the EAHCP are assumed when calculating existing surface water supply. The EAHCP is considered a water management strategy as well due to the phased implementation of the program elements. The EAHCP is included as a strategy so that these program elements may be eligible for TWDB funding. The unit cost for the EAHCP, based on an increase in firm Edwards Aquifer supply of about 50,600 acft/yr, is \$345/acft/yr. Volume II, Chapter 5.2.5 includes a detailed discussion of this recommended water management strategy.

5.1.6 Edwards Transfers

The Edwards Transfers water management strategy is based upon the provisions of Senate Bill 1477, as amended, which created the Edwards Aquifer Authority, established a withdrawal permit system, and allows a permit holder to sell or lease up to 50 percent of his irrigation rights. In the 2016 Regional Water Plan, Edwards transfers are included to meet projected needs of 16 municipal water user groups and provide a firm supply of about 11,800 acft/yr by 2070. The Initial Regular Permit (IRP) volume needed to obtain this firm supply is about 20,100 acft/yr accounting for critical period withdrawal reductions. As implementation of the EAHCP is expected to use all remaining unrestricted irrigation permits, large municipalities having alternative supplies are considered the primary sources for Edwards Transfers in the 2016 SCTRWP. Based on what it might cost a large municipalities, typical unit costs are estimated at \$1,415 per acft/yr. Volume II, Chapter 5.2.6 includes a detailed discussion of this recommended water management strategy.

5.1.7 Local Groundwater Supplies

Local Groundwater Supplies (Carrizo-Wilcox and/or Yegua-Jackson)

The Local Carrizo water management strategy involves the phased development or expansion of well fields in the Carrizo-Wilcox Aquifer¹ for the purposes of meeting local municipal needs in Atascosa, Caldwell, Dimmit, Frio, Karnes, La Salle, Medina, Wilson, and Zavala Counties. Planned implementation of this strategy provides new dependable

¹ In the case of Karnes City, potential source could be Carrizo-Wilcox and/or Yegua-Jackson Aquifers.

supplies totaling about 3,388 acft/yr for the South Central Texas Region in 2070 at estimated unit costs ranging from \$516/acft/yr to \$5,150/acft/yr. Volume II, Chapter 5.2.7 includes a detailed discussion of this recommended water management strategy.

Local Groundwater Supplies (Trinity)

The Local Trinity water management strategy involves the development of 3,245 acft/yr of water supply from the Trinity Aquifer in Comal, Hays, and Kendall Counties. Estimated unit costs range from \$673/acft/yr to \$1,635/acft/yr. Volume II, Chapter 5.2.7 includes a detailed discussion of this recommended management strategy.

Local Groundwater Supplies (Gulf Coast)

The Local Gulf Coast water management strategy involves development of 309 acft/yr for new local municipal and mining supplies in the Gulf Coast Aquifer in DeWitt and Karnes Counties. Estimated unit costs for the new supplies range from \$130/acft/yr to \$3,111/acft/yr. Volume II, Chapter 5.2.7 includes a detailed discussion of this recommended water management strategy.

Local Groundwater Supplies (Leona Gravels)

The Local Leona Gravels water management strategy involves development of 895 acft/yr for new local municipal supplies in the Leona Gravels Aquifer in Medina County. Estimated unit costs for the new supplies range from \$2,565/acft/yr to \$5,317/acft/yr. Volume II, Chapter 5.2.7 includes a detailed discussion of this recommended water management strategy.

5.1.8 Local Carrizo Conversions

The Local Carrizo Conversions water management strategy is intended to be used by WUGs where the Local Groundwater WMS is the primary recommended strategy to meet their needs and the groundwater available is limited due to Modeled Available Groundwater (MAG) estimates. The strategy includes purchasing and/or leasing existing irrigation or mining groundwater permits and converting the type of use to municipal. Local Carrizo Conversions are intended to be used within the same county and between willing sellers and willing buyers. Volume II, Chapter 5.2.8 includes a detailed discussion of this recommended water management strategy.

5.1.9 NBU Aquifer Storage & Recovery

NBU is considering an Aquifer Storage and Recovery (ASR) (dual-purpose wells) project to more effectively use their existing supplies. NBU expects an ASR strategy to provide a long-term supply during drought-of-record (DOR), defer construction of a second water treatment plant, meet seasonal demands when restrictions are imposed, meet demands at the ends of the distribution system, and provide an emergency supply. The concept of an ASR system is to store water during times of plenty and to recover the water during times of shortage. The NBU ASR project is expected to add 8,300 acft/yr of new supply by 2070, when coupled with a WTP expansion of 7.5 MGD, at a unit cost of \$462/acft/yr. Volume II, Chapter 5.2.9 includes a detailed discussion of this recommended water management strategy.

5.1.10 NBU Trinity Aquifer

NBU is considering adding Trinity Aquifer wells as another water supply source. The strategy includes a Trinity well field, production facilities, and integration into the current distribution system. The NBU Trinity Aquifer project is expected to add 1,090 acft/yr at a unit cost of \$634/acft/yr. Volume II, Chapter 5.2.10 includes a detailed discussion of this recommended water management strategy.

5.1.11 Expanded Carrizo for Schertz-Seguin Local Government Corporation (SSLGC)

The Expanded Carrizo for Schertz-Seguin Local Government Corporation (SSLGC) water management strategy involves the expansion of well fields located in Guadalupe County by the SSLGC. The SSLGC was created to develop and operate a wholesale water supply system to serve the long-term needs of several communities located in Guadalupe and Bexar Counties. This strategy focuses on the development of additional well fields and associated collection and treatment systems as primary transmission facilities for delivery of water to customers are operating at this time. Planned implementation of this strategy will provide an additional dependable annual supply of approximately 6,500 acft/yr at an estimated unit cost of \$1,070/acft/yr. Volume II, Chapter 5.2.11 includes a detailed discussion of this recommended water management strategy.

5.1.12 Brackish Wilcox for SSLGC

The Brackish Wilcox for SSLGC water management strategy involves the installation of wells into the brackish portion of the Wilcox Aquifer within the same Gonzales County well field currently utilized by SSLGC for fresh Carrizo water. This strategy focuses on the development of additional wells and associated collection and treatment systems. Envisioned implementation of this strategy will provide an additional dependable annual supply of approximately 5,000 acft/yr. However, due to MAG limitations within Gonzales County, the recommend firm supply from this project is 1,278 acft/yr at an estimated unit cost of \$5,032/acft/yr. Volume II, Chapter 5.2.12 includes a detailed discussion of this recommended water management strategy.

5.1.13 Brackish Wilcox Groundwater for SS WSC

The Brackish Wilcox Groundwater for SS Water Supply Corporation (SSWSC) water management strategy includes developing a brackish groundwater supply from the Wilcox Aquifer in Wilson County for the SSWSC. It is envisioned to produce an average annual water supply of 1.0 MGD (1,120 acft/yr) at a peak rate of 2.0 MGD. The project facilities are planned to be located in the vicinity of the SSWSC Sutherland Springs Road Plant, which is located about 3 miles west-northwest of Sutherland Springs. The facilities include Wilcox Aquifer wells to provide a brackish groundwater supply, water treatment plant for pretreatment and desalination, delivery of treated water to the existing distribution system, and concentrate disposal to deep injection wells. Due to MAG limitations within Wilson County, the recommend firm supply from this project is 0 acft/yr. Volume II, Chapter 5.2.13 includes a detailed discussion of this recommended water management strategy.

5.1.14 Cibolo Valley LGC Carrizo Project

The Cibolo Valley LGC Carrizo Project is a water management strategy to develop a groundwater supply from the Carrizo Aquifer in Wilson County. The project is envisioned to deliver up to 10,000 acft/yr to the cities of Cibolo and Schertz, however, due to MAG limitations within Wilson County, the recommend firm supply from this project is 0 acft/yr. By adding conversion of groundwater permits from irrigation to municipal, the Cibolo Valley LGC Carrizo Project has a firm supply of 10,000 acft/yr as a recommended water management strategy. Volume II, Chapter 5.2.14 includes a detailed discussion of this recommended water management strategy.

5.1.15 Uvalde ASR

Uvalde is considering an Aquifer Storage and Recovery (ASR) (dual-purpose wells) project in conjunction with new wells in the Austin Chalk and Buda Limestone Aquifers to develop a new firm water supply. Uvalde expects this ASR strategy to provide a long-term supply during drought-of-record for Uvalde, Sabinal, and Knippa. The concept of an ASR system is to store water during times of plenty and to recover the water during times of shortage. The Uvalde ASR project is envisioned to add 4,000 acft/yr of new supply by 2070. However, due to MAG limitations within Uvalde County, the recommend firm supply from this project is 1,155 acft/yr at a unit cost of \$2,803/acft/yr. Volume II, Chapter 5.2.15 includes a detailed discussion of this recommended water management strategy.

5.1.16 CRWA Wells Ranch Project – Phase II

Canyon Regional Water Authority (CRWA) is in the planning, permitting, and construction stages of Phase II of their Wells Ranch Project, straddling the border of Guadalupe and Gonzales Counties. Phase II is envisioned to supply an additional 10,629 acft/yr in the future. However, due to MAG limitations, the recommended firm supply of the project is 7,829 acft/yr at a unit cost of \$858/acft/yr. Volume II, Chapter 5.2.16 includes a detailed discussion of this recommended water management strategy.

5.1.17 CRWA Siesta Project

The Canyon Regional Water Authority (CRWA) Siesta Project is planned as a conjunctive use project using interruptible diversions from Cibolo Creek in Wilson County along with treated effluent from wastewater treatment facilities operated by San Antonio River Authority (SARA) as raw water sources for treatment and distribution as a new municipal water supply for CRWA members. Should treated effluent from wastewater treatment facilities not be available, the project could include brackish groundwater as an alternate back-up source. The Siesta Project involves the acquisition/lease of additional water rights and amendment of a surface water right presently held by CRWA in order to increase authorized diversions from Cibolo Creek by CRWA from 42 acft/yr to 5,042 acft/yr. Planned implementation of this strategy could provide an additional dependable annual supply of approximately 5,042 acft/yr at an estimated cost of \$1,886/acft/yr. Volume II, Chapter 5.2.17 includes a detailed discussion of this recommended water management strategy.

5.1.18 Brackish Wilcox Groundwater for CRWA

The Brackish Wilcox Groundwater for CRWA water management strategy includes developing a brackish groundwater supply from the Wilcox Aquifer in Guadalupe and Wilson Counties for CRWA members. It is envisioned to produce an average annual water supply of 14,700 acft/yr with a 1.3 peaking factor. Due to MAG limitations, the recommended firm supply of this project is 3,839 acft/yr at a unit cost of \$2,619/acft/yr. The well field is planned for northern Wilson County and southern Guadalupe County near SH 123. The water will be delivered to the Liessner Booster Station for distribution to participating water utilities. Volume II, Chapter 5.2.18 includes a detailed discussion of this recommended water management strategy.

5.1.19 Brackish Wilcox Groundwater for SAWS

Brackish Wilcox Groundwater for SAWS is a water management strategy based on the development of brackish groundwater in the Wilcox Aquifer in southern Bexar County. The project consists of three phases that are envisioned to produce a total of 33,600 acft/yr of potable water. Due to MAG limitations, the recommend firm supply of this project is 5,622 acft/yr at a unit cost of \$1,289/acft/yr. Volume II, Chapter 5.2.19 includes a detailed discussion of this recommended water management strategy.

5.1.20 Expanded Brackish Groundwater for SAWS

The Expanded Brackish Groundwater for SAWS water management strategy is envisioned to produce up to 50,000 acft/yr of brackish groundwater from the Wilcox Aquifer in Wilson County. Due to MAG limitations, the recommend firm supply of this project is 0 acft/yr. The project is in two phases that would deliver the brackish water to SAWS desalination plant in southern Bexar County. Volume II, Chapter 5.2.20 includes a detailed discussion of this recommended water management strategy.

5.1.21 Expanded Local Carrizo Groundwater for SAWS

The Expanded Local Carrizo Groundwater for SAWS water management strategy is envisioned to produce up to 30,000 acft/yr of fresh groundwater from the Carrizo Aquifer in Bexar County. Due to MAG limitations, the recommend firm supply of this project is 5,419 acft/yr at a unit cost of \$700/acft/yr. Volume II, Chapter 5.2.21 includes a detailed discussion of this recommended water management strategy.

5.1.22 SAWS Seawater Desalination

The SAWS Seawater Desalination water management strategy involves the long-term development of intake and treatment facilities on the north shore of San Antonio Bay near Seadrift and transmission of treated water for integration and use in Bexar County. This water management strategy utilizes a source of water that is essentially unlimited; however, costs of treatment and location for brine discharge (as may affect marine habitat and species) remain concerns. Planned implementation of this strategy will provide a dependable annual supply of approximately 84,000 acft by 2070 at an estimated unit cost of \$2,713/acft/yr. Volume II, Chapter 5.2.22 includes a detailed discussion of this recommended water management strategy.

5.1.23 SAWS Vista Ridge

SAWS has contracted with Vista Ridge Consortium for up to 50,000 acft/yr of groundwater supply from Burleson County, Texas. Vista Ridge holds permits from the Post Oak Savannah Groundwater Conservation District for withdrawal of up to 70,000 acft/yr from the Carrizo–Wilcox Aquifer in Burleson County. The project includes a well field, collection system, treatment, and 143 miles of 54-inch and 60-inch transmission pipelines, and will deliver water to northern Bexar County for integration into the SAWS distribution system. Due to MAG limitations, the recommended firm supply for this project is 34,894 acft/yr by 2070 at a unit cost of \$2,177/acft/yr. Volume II, Chapter 5.2.23 includes a detailed discussion of this recommended water management strategy.

5.1.24 Hays/Caldwell PUA Project

The Hays/Caldwell PUA Project envisions the development of about 35,690 acft/yr of dependable supply from the Carrizo Aquifer in Caldwell and Gonzales Counties. The HCPUA currently holds 10,300 acft/yr of groundwater permits from the Gonzales County Underground Water Conservation District (GCUWCD) in Caldwell County. Due to MAG limitations, the recommended firm supply for the project is 21,833 acft/yr at an estimated unit cost of \$1,926/acft/yr. Volume II, Chapter 5.2.25 includes a detailed discussion of this recommended water management strategy.

5.1.25 TWA Carrizo Project

The Texas Water Alliance (TWA) is currently has groundwater leases in Gonzales County and permits from the GCUWCD for up to 15,000 acft/yr of Carrizo Aquifer groundwater for delivery to entities in Guadalupe, Hays, and Comal Counties. Due to MAG limitations, the recommended firm supply of the project is 14,680 acft/yr at an estimated unit cost of \$2,490/acft/yr. Volume II, Chapter 5.2.26 includes a more detailed discussion of this recommended water management strategy.

5.1.26 TWA Trinity Project

TWA is considering a Trinity Aquifer well field in western Comal County for up to 5,000 acft/yr of new supply for delivery to entities in Comal and Hays Counties. Currently, there is not a groundwater conservation district in Comal County to regulate the Trinity Aquifer. The estimated unit cost of the project is \$613/acft/yr. Volume II, Chapter 5.2.27 includes a more detailed discussion of this recommended water management strategy.

5.1.27 GBRA Mid-Basin Water Supply Project – ASR

The Guadalupe-Blanco River Authority (GBRA) is in the planning and permitting stages of a phased Mid-Basin Water Supply Project (MBWSP) to provide supplemental water supplies directly to participants in Comal, Caldwell, Hays, and/or Guadalupe Counties. GBRA is currently considering four general formulations of the MBWSP using available surface water and/or groundwater supply sources to ensure unrestricted delivery of a firm yield of up to 50,000 acft/yr. The recommended water management strategy focuses on an Aquifer Storage and Recover (ASR) formulation which includes run-ofriver diversions from the Guadalupe River near Gonzales, treatment, and transmission to participants or ASR wells in Gonzales County for storage and subsequent recovery during periods when run-of-river diversions are limited. The project has a firm yield of 50,000 acft/yr at an estimated unit cost of \$1,637/acft/yr. GBRA's Application No. 12378 for the surface water rights associated with this water management strategy has been declared administratively complete by the Texas Commission on Environmental Quality (TCEQ). Volume II, Chapter 5.2.33 includes a detailed discussion of this recommended water management strategy.

5.1.28 GBRA New Appropriation (Lower Basin)

The GBRA New Appropriation (Lower Basin) water management strategy involves diversion of up to 189,484 acft/yr under a new appropriation from the Guadalupe River in Calhoun County using existing gravity-flow diversion facilities located immediately upstream of GBRA's Saltwater Barrier and Diversion Dam at a rate of diversion not to exceed 500 cfs (within the existing 622 cfs maximum authorized diversion rate) and authorization to impound up to 200,000 acft in Calhoun County. The diversions and storage will serve municipal and industrial water users in GBRA's ten-county statutory district and are the subject of Application No. 12482 for surface water rights pending before the TCEQ. The firm supply from this strategy, with a 150,000 acft off-channel reservoir, is 42,000 acft/yr available at a unit cost of \$591/acft/yr for raw water at the reservoir. Volume II, Chapter 5.2.34 includes a detailed discussion of this recommended water management strategy.

5.1.29 GBRA Lower Basin Storage

The GBRA and Dow Chemical Company (Dow), individually and collectively, own surface water rights in the lower Guadalupe – San Antonio River Basin authorizing diversions totaling 175,501 acre-feet per year (acft/yr). In order to firm up the GBRA/Dow water rights, a 12,500 acft off-channel reservoir supplied from the GBRA Main Canal by a new intake, pump station, and appurtenant transmission facilities is recommended for implementation. The estimated project firm yield is 51,800 acft/yr available at a unit cost of \$140/acft/yr for raw water at the reservoir or Main Canal. Volume II, Chapter 5.2.35 includes a detailed discussion of this recommended water management strategy.

5.1.30 Victoria County Steam-Electric Project

The Victoria County Steam-Electric Project involves the development of a reliable supply of cooling water to serve a future power plant in Victoria County. Water available under GBRA/Dow existing surface water rights would be diverted from the GBRA Main Canal and delivered to an off-channel cooling reservoir in Victoria County. Using a junior portion of the GBRA/Dow existing water rights, the firm supply of the project is 29,100 acft/yr at an estimated unit cost of \$1,225/acft/yr for raw water. Volume II, Chapter 5.2.37 includes a detailed discussion of this recommended water management strategy.

5.1.31 GBRA Integrated Water-Power Project (IWPP)

GBRA is considering desalination of seawater from the Gulf of Mexico as a potential source of freshwater supplies for municipal and industrial use. The GBRA Integrated

Water Power Project (IWPP) water management strategy includes a large-scale seawater desalination water treatment plant with a finished water production capacity of 100,000 acft/yr (89.3 MGD). For regional water planning purposes, GBRA proposes a preliminary water treatment plant location in Calhoun County and transmission facilities to accommodate potential delivery of 50,000 acft/yr to Calhoun and Victoria Counties and 50,000 acft/yr to DeWitt and Gonzales Counties. The estimated unit cost of water for this project is \$2,393/acft/yr. Volume II, Chapter 5.2.38 includes a detailed discussion of this recommended water management strategy.

5.1.32 Purchase from Wholesale Water Provider

The Purchase from Wholesale Water Provider water management strategy involves the purchase of water supplies from, or participation in the development of new water supplies with, an identified Wholesale Water Provider. Wholesale water providers include the San Antonio Water System (SAWS), Guadalupe-Blanco River Authority (GBRA), Canyon Regional Water Authority (CRWA), Schertz-Seguin Local Government Corporation (SSLGC), Springs Hill Water Supply Corporation (SHWSC), the Texas Water Alliance (TWA), Hays Caldwell Public Utility Agency (HCPUA), and Cibolo Valley Local Government Corporation (CVLGC). Costs for this management strategy generally include those for purchase, treatment, transmission, and distribution of water, and are approximated by a weighted system cost to the WWP associated with developing new supplies through phased implementation of one or more water management strategies. Proposed new purchases from WWPs in the region total approximately 368,000 acft/yr in 2070 at unit costs ranging from \$510/acft to \$2,490/acft. Chapter 5.2.41 includes a detailed discussion of this recommended water management strategy.

5.1.33 Surface Water Rights

The Surface Water Rights water management strategy is included to explicitly recognize that use of water supplies made available under existing water rights by lease or purchase agreements between willing buyers and willing sellers is an activity consistent with the 2016 SCTRWP. The additions of diversion points or types and places of use for existing surface water rights are also activities consistent with the 2016 SCTRWP if necessary authorizations are obtained pursuant to TCEQ rules and applicable law. Volume II, Chapter 5.2.42 includes a more detailed discussion of this recommended water management strategy.

5.1.34 Balancing Storage

The Balancing Storage water management strategy is included to explicitly recognize that storage is needed at several locations within the region in order to firm up supplies from run-of-river diversions or interruptible groundwater sources and to ensure that supplies delivered through long distance conveyance facilities are available during drought and of sufficient quantity to meet daily and seasonal demands. The addition of Balancing Storage on the surface or in an aquifer (ASR) is an activity consistent with the 2016 SCTRWP, if necessary authorizations are obtained pursuant to TCEQ or groundwater conservation district rules and applicable law. Volume II, Chapter 5.2.43 includes a more detailed discussion of this recommended water management strategy.

5.1.35 Victoria ASR

The City of Victoria is considering an ASR project to aid in firming up their existing run-ofriver water supplies. The strategy involves retrofitting six existing wells and construction of 10 new ASR wells. Because the Victoria WTP has excess capacity and all the wells are within the city limits, no costs are necessary for treatment or transmission. The strategy will yield approximately 7,900 acft/yr at an estimated unit cost of \$192/acft/yr. Volume II, Chapter 5.2.45 includes a more detailed discussion of this recommended water management strategy.

5.1.36 Victoria Groundwater-Surface Water Exchange

The City of Victoria plans to expand their groundwater-surface water exchange, a program in which surface water diversions during times they would otherwise be restricted may continue as a result of fresh groundwater discharge into a tributary of the Guadalupe River. Hence, the recommended water management strategy is adding special conditions authorizing groundwater offset to more of Victoria's current water rights thereby increasing firm supply from surface water by 8,544 acft/yr at little, if any, additional cost. Volume II, Chapter 5.2.46 includes a more detailed discussion of this recommended water management strategy.

5.1.37 List of Alternative Water Management Strategies

The following is the list of alternative water management strategies in the 2016 SCTRWP:

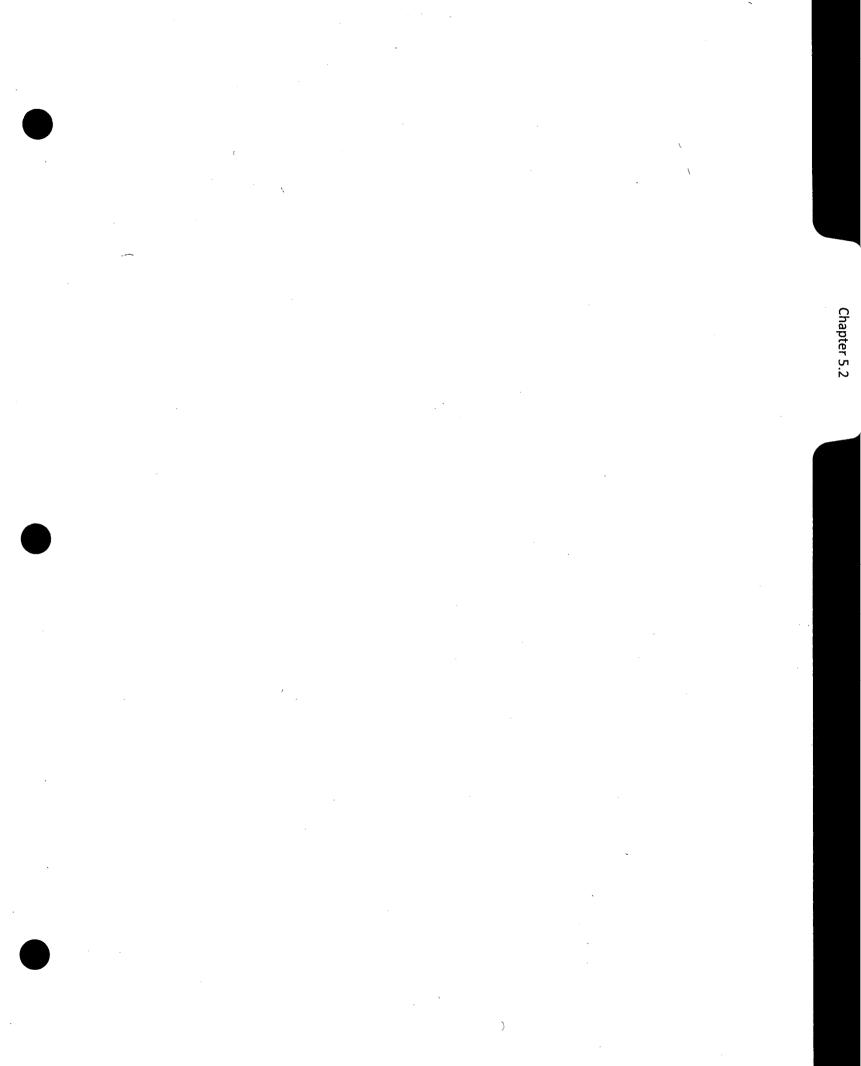

- 1. Local Groundwater Supplies (Various Aquifers) (See Chapter 5.2.7)
- 2. Brackish Wilcox for SSLGC Envisioned (See Chapter 5.2.12)
- 3. Brackish Wilcox for SS WSC Envisioned (See Chapter 5.2.13)
- 4. Cibolo Valley LGC Carrizo Project Envisioned (See Chapter 5.2.14)
- 5. Uvalde ASR Envisioned (See Chapter 5.2.15)
- 6. CRWA Wells Ranch Phase 2 Envisioned (See Chapter 5.2.16)
- 7. Brackish Wilcox Groundwater for CRWA Envisioned (See Chapter 5.2.18)
- 8. Brackish Wilcox Groundwater for SAWS Envisioned (See Chapter 5.2.19)
- 9. SAWS Expanded Brackish Project Envisioned (See Chapter 5.2.20)
- 10. SAWS Expanded Local Carrizo Envisioned (See Chapter 5.2.21)
- 11. Vista Ridge Project Envisioned (See Chapter 5.2.23)
- 12. Hays/Caldwell PUA Project Phase I & II Envisioned (See Chapter 5.2.25)
- 13. TWA Carrizo Project Envisioned (See Chapter 5.2.26)
- 14. HCPUA/TWA Joint Project (See Chapter 5.2.28)
- 15. HCPUA/TWA/GBRA MBWSP Shared Facilities Project (See Chapter 5.2.29)
- 16. GBRA Mid-Basin Water Supply Project Carrizo Only (See Chapter 5.2.30)

- 17. GBRA Mid-Basin Water Supply Project Surface Water (See Chapter 5.2.31)
- 18. GBRA Mid-Basin Water Supply Project Conjunctive Use with ASR (See Chapter 5.2.32)
- 19. Luling ASR (See Chapter 5.2.36)
- 20. Lavaca Off-Channel Reservoir (See Chapter 5.2.40)

5.1.38 List of Water Management Strategies Needing Further Study and/or Funding

The following is the list of water management strategies that need further study and/or funding in the 2016 SCTRWP:

- 1. Storage above Canyon Reservoir ASR (See Chapter 5.2.39)
- 2. Brush Management in Gonzales County (See Chapter 5.2.44)

FX

5.2 Water Management Strategy Evaluations

Water management strategy evaluations can be found in Volume II of the 2016 South Central Texas Regional Water Plan.

5.3 Water User Group Plans by County

The proposed plan to meet the specific needs of municipal, industrial, steam-electric power, and mining water user groups located within the region is to implement water conservation programs to reduce water demands to the extent possible, and develop additional groundwater and surface water supplies located as near as possible to each respective water user to the extent that supplies are available. As local supply development potentials for each respective user group are exhausted, water management strategies located at greater distances from the water users are recommended.

In the case of the irrigation water user group, the South Central Texas Regional Water Planning Group found that, at the present time, it is not economically feasible to meet all of the projected irrigation water need (shortage). However, the proposed plan encourages the irrigation water conservation to meet as much as possible of the projected irrigation needs of the region. Therefore, each individual irrigation water user is encouraged to install Low Energy Precision Application (LEPA), or other efficient irrigation systems which will result in irrigation water savings due to lower irrigation water application requirements.

In the case of "Rural Area Residential and Commercial" (individual households and business establishments) water users, the projections have included local surface and groundwater quantities to meet projected needs. However, no specific plans have been formulated to supply the projected quantities of water needed. Instead, it is presumed that those individual households and businesses that are located in rural areas, and rural and investor owned water supply districts, authorities, and companies (those that supplied less than 280 acft or had populations less than 500 in year 2010) that operate public water supply systems to serve rural areas will meet these needs either from locally available supplies, or through arrangements to obtain water from other water utilities. Plans are included for all public water suppliers (cities and water supply districts and authorities) that provided 280 acft or more and/or had populations of 500 or more in year 2010.

Water management strategies recommended for implementation to meet projected needs or shortages in each of the 21 counties within the South Central Texas Region are summarized in a table included as Appendix E. These figures and tables illustrate the phased implementation of water management strategies within each county to meet the needs of WUGs located within the county. Counties are presented in alphabetical order from Atascosa County to Zavala County. The counties having the greatest combined municipal, industrial, steam-electric, and mining needs and, hence, needing the greatest quantities of new water supply are Bexar, Comal, Hays, and Victoria. Particular attention to the notes in each county table is encouraged. More detailed information regarding allocation of new water supplies to specific cities and other water user groups within each county may be found in the detailed plans for each of the 21 counties of the South Central Texas Planning Region, which are presented in alphabetic order in the following subsections. In each county plan, each water user group of the county is listed, and water conservation has been included in the plan for each municipal water user and the irrigation user group, where appropriate. In addition, if the water user group has a need

(shortage) during the planning horizon, one or more water management strategies are recommended to meet the need.

The total unit costs of potable water (surface water treated to regulatory standards for public supply and/or groundwater that meets regulatory standards for public supply), delivered to the water user groups' retail distribution systems were computed as follows. For water user groups whose needs can be met from a single local source by an individual water management strategy that can be scheduled and sized to meet that particular need, such as local groundwater for the City of Floresville, annual and unit costs in September 2013 prices are presented for additional wells to be added at the time of the projected need. Costs were calculated in accordance with TWDB guidance and are presented in Volume II and the following county tables. In this case, and in many cases described herein, water treatment and associated facilities were sized to meet service and operation and maintenance costs are calculated accordingly.

For water user groups that do not have the potential to implement readily available individual water management strategies using local sources of supply to meet their individual needs at the time these needs are projected to occur, such as utilities of Bexar, Caldwell, Comal, Guadalupe, and Hays Counties, large-scale water management strategies to meet regional needs involving two or more water user groups are recommended by the SCTRWPG in the regional water plan. In the latter cases, total and unit costs (September 2013 prices) are calculated to obtain, convey, treat, and deliver potable water (surface and/or groundwater that meets regulatory standards for public supply) to the respective water user groups' retail distribution systems. As was the case for individual local systems, the costs are computed according to TWDB guidance and are reported in Volume II and are tabulated in the respective county tables on the following pages.

It was necessary to allocate the costs of large-scale, regional water management strategies among the water user groups they are intended to serve. The allocation procedure was to prorate the total annual costs to each water user group to be supplied from a water management strategy based on the water user group's proportion or share of quantity obtained from that strategy in each decade. In this way, a unit cost representative of the strategy in full operation is shown for all participating water user groups. Water user groups may actually be required to begin paying their pro-rata share of annual debt service at the time the strategy is implemented based on their ultimate share of the new supply whether or not they have begun taking water. The basis for this principle of dividing debt service among water user groups is to facilitate the development of a strategy to its relevant size, and to assure that those user groups who need the water will have invested in and thereby reserved their respective shares so that water will be there when needed. In the case of the South Central Texas Region, many water user groups will need the water as soon as the water management strategy can be implemented. It is important to note that individual water user groups could participate in the development of a water management strategy in the cost sharing manner outlined here, and then lease part or all of their respective shares to others until they have grown enough to fully utilize them. Therefore, few, if any user groups would be paying debt service for idle capacity.

It has been assumed that one or more wholesale water providers will implement the large-scale, distantly located water management strategies recommended in the Regional Plan, and since these supplies are needed as soon as possible, the water user groups (customers) will begin paying debt service and operation and maintenance costs on the basis of their pro-rata share of the quantities of water taken. For example, if SAWS implements a strategy, SAWS and its customers will use the water and pay all the costs. If some other supplier implements a strategy, the costs would be prorated among the users on the basis of the proportion of the quantity taken.

Recommended and alternative water management strategies to meet the projected needs of each city, utility, water user group, and wholesale water provider in the South Central Texas Region are summarized in tables generated by the TWDB Regional Water Planning Database (DB17) in Appendix A.

2016 South Central Texas Regional Water Plan Volume I

This page intentionally left blank.

5.3.1 Atascosa County Water Supply Plan

Table 5.3.1-1 lists each water user group in Atascosa County and its corresponding management supply or shortage in 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.1-1. Atascosa	County Supply/Shortage	by Water User Group
-------------------------	-------------------------------	---------------------

		ement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
Benton City WSC	975	-25	Projected shortage (2070 Only)
City of Charlotte	346	143	No projected shortage
City of Jourdanton	1135	550	No projected shortage
City of Lytle	-171	-554	Projected shortage (2020 through 2070)
McCoy WSC	633	70	No projected shortage
City of Pleasanton	1,494	92	No projected shortage
City of Poteet	946	688	No projected shortage
Rural Area Residential and Commercial	511	1	No projected shortage
Industrial/Manufacturing	0	0	No projected shortage
Steam-Electric Power	3,848	836	No projected shortage
Mining	0	0	No projected shortage
Irrigation	0	0	No projected shortage
Livestock	0	0	No projected shortage

5.3.1.1 Benton City WSC

Current water supply for Benton City WSC is obtained from the Carrizo-Wilcox Aquifer. Benton City WSC is projected to need additional water supplies prior to 2070. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Benton City WSC implement the following water supply plan to meet their projected needs (Table 5.3.1-2).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 57 acft/yr by 2070.

• A Local Carrizo Groundwater¹ with conversion from Irrigation sources to be implemented prior to 2070 can provide an additional 80 acft/yr.

Table 5.3.1-2. Recommended Water Supply Plan for Benton City WSC

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.1.2 City of Charlotte

The City of Charlotte is projected to have adequate water supplies available from the Carrizo-Wilcox Aquifer to meet the city's projected demands during the planning period.

Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Charlotte implement the following water supply plan (Table 5.3.1-4).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 9 acft/yr by 2020, increasing to 74 acft/yr of supply in 2070.

Table 5.3.1-4. Recommended Water Supply Plan for the City of Charlotte

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.1.3 City of Jourdanton

Current water supply for City of Jourdanton is obtained from the Carrizo-Wilcox Aquifer and is projected to have adequate supply through 2070. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Jourdanton implement the following water supply plan (Table 5.3.1-6).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 36 acft/yr by 2020, increasing to 415 acft/yr of supply in 2070.

Table 5.3.1-6. Recommended Water Supply Plan for the City of Jourdanton

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Table 5.3.1-7. Recommended Plan Costs by Decade for the City of Jourdanton

5.3.1.4 City of Lytle

Current water supply for the City of Lytle is obtained from the Edwards Aquifer. Lytle is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Lytle implement the following water supply plan to meet the projected needs for the city (Table 5.3.1-8).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 18 acft/yr by 2020, increasing to 207 acft/yr of supply in 2070.
- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional 171 acft/yr by 2020, increasing to 554 acft/yr by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 9 acft/yr in 2020.

5.3.1.5 McCoy WSC

McCoy WSC is projected to have adequate water supplies available from the Carrizo-Wilcox Aquifer to meet projected demands during the planning period.

5.3.1.6 City of Pleasanton

The City of Pleasanton is projected to have adequate water supplies available from the Carrizo-Wilcox Aquifer to meet the city's projected demands during the planning period.

Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Pleasanton implement the following water supply plan (Table 5.3.1-10).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 89 acft/yr by 2020, increasing to 1,062 acft/yr of supply in 2070.

Table 5.3.1-10. Recommended Water Supply Plan for the City of Pleasanton

Table 5.3.1-11. Recommended Plan Costs by Decade for the City of Pleasanton

5.3.1.7 City of Poteet

The City of Poteet is projected to have adequate water supplies available from the Carrizo-Wilcox Aquifer to meet the city's projected demands during the planning period.

5.3.1.8 Rural Area Residential and Commercial

Rural areas are projected to have adequate water supplies available from the Carrizo-Wilcox and Sparta Aquifers to meet their projected demands during the planning period.

5.3.1.9 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Carrizo-Wilcox Aquifer to meet the water user group's projected demand during the planning period.

5.3.1.10 Steam-Electric Power

Steam-Electric is projected to have adequate water supplies available from the Carrizo-Wilcox Aquifer to meet the water user group's projected demand during the planning period.

5.3.1.11 Mining

Mining is projected to have adequate water supplies available from the Carrizo-Wilcox and Queen City Aquifers to meet the water user group's projected demand during the planning period.

5.3.1.12 Irrigation

Irrigation is projected to have adequate water supplies available from the Edwards, Carrizo-Wilcox, Sparta, and Queen City Aquifers, and run-of-river rights.

5.3.1.13 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

Bexar County Water Supply Plan 5.3.2

Table 5.3.2-1 lists each water user group in Bexar County and its corresponding management supply or shortage in 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

	Management Supply/Shortage		
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
City of Alamo Heights	-796	-805	Projected shortage (2020 through 2070)
Atascosa Rural WSC	-1167	-2448	Projected shortage (2020 through 2070)
City of Balcones Heights	0	0	No projected shortage
City of Castle Hills	395	349	No projected shortage
City of China Grove	316	474	No projected shortage
City of Converse	-903	-1,246	Projected shortage (2020 through 2070)
East Central SUD	289	-724	Projected shortage (2040 through 2070)
City of Elmendorf	311	696	No projected shortage
City of Fair Oaks Ranch	1,707	302	No projected shortage
Green Valley SUD			See Guadalupe County
City of Helotes	0	0	No projected shortage
City of Hill Country Village	0	0	No projected shortage
City of Hollywood Park	0	0	No projected shortage
City of Kirby	-137	-169	Projected shortage (2020 through 2070)
City of Lytle			See Atascosa County
Lackland AFB (CDP)	946	1,041	No projected shortage
City of Leon Valley	-97	-377	Projected shortage (2020 through 2070)
City of Live Oak	512	551	No projected shortage
City of Olmos Park	0	0	No projected shortage
Randolph AFB	1,903	1,849	No projected shortage
City of San Antonio	-47,664	-155,099	Projected shortage (2020 through 2070)

Livestock	0	0	No projected shortage

5.3.2.1 City of Alamo Heights

Current water supply fcr the City of Alamo Heights is obtained from the Edwards Aquifer. Alamo Heights is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Alamo Heights implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 104 acft/yr by 2020, increasing to 895 acft/yr of supply in 2070.

- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional supply of 796 acft/yr by 2020, increasing to 805 acft/yr of additional supply by 2070.
- Purchase from Wholesale Water Provider (SAWS) to be implemented prior to 2020. This strategy can provide an additional supply of 796 acft/yr by 2020, increasing to 805 acft/yr of additional supply by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 111 acft/yr in 2020.

Table 5.3.2-2. Recommended Water Supply Plan for the City of Alamo Heights

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.2.2 Atascosa Rural WSC

Current water supply for Atascosa Rural WSC is obtained from the Edwards Aquifer. Atascosa Rural WSC is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Atascosa Rural WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.2-4).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 55 acft/yr by 2070.
- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional supply of 1,167 acft/yr by 2020, increasing to 2,448 acft/yr of additional supply by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 80 acft/yr by 2020.
- Purchase from Wholesale Water Provider (SAWS) to be implemented prior to 2020. This strategy can provide an additional supply of 1,167 acft/yr by 2020 increasing to 2,448 in 2070.
- Facilities Expansions (System Interconnections)

5.3.2.3 City of Balcones Heights

The City of Balcones Heights is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Balcones Heights implement the following water supply plan (Table 5.3.2-6).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 12 acft/yr by 2060, increasing to 32 acft/yr of supply in 2070.

Table 5.3.2-6. Recommended Water Supply Plan for the City of Balcones Heights

5.3.2.4 City of Castle Hills

The City of Castle Hills is projected to have adequate water supplies available from the Edwards Aquifer through SAWS to meet the city's projected demands during the planning period.

5.3.2.5 City of China Grove

The City of China Grove is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of China Grove implement the following water supply plan (Table 5.3.2-8).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 13 acft/yr by 2020, increasing to 155 acft/yr of supply in 2070.

5.3.2.6 City of Converse

Current water supply for the City of Converse is obtained from the Edwards Aquifer. Converse is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Converse implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-10).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 9 acft/yr by 2070.
- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional supply of 903 acft/yr by 2020, increasing to 1,264 acft/yr of additional supply by 2070.
- Purchase from WWP (CRWA) to be implemented prior to 2020. This strategy can provide an additional 903 acft/yr of supply by 2030, increasing to 1,264 by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 127 acft/yr by 2020

5.3.2.7 East Central SUD

East Central SUD obtains groundwater supplies from the Edwards and Carrizo-Wilcox Aquifers and surface water from Canyon Reservoir to meet the city's projected demands during the planning period. East Central SUD is projected to need additional water supplies prior to 2040. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Converse implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-12).

• Purchase from WWP (CRWA) to be implemented prior to 2030. This strategy can provide an additional 500 acft/yr of supply by 2030, increasing to 724 by 2070.

Table 5.3.2-12. Recommended Water Supply Plan for the City of East Central SUD

5.3.2.8 City of Elmendorf

The City of Elmendorf is projected to have adequate water supplies available from the Edwards Aquifer through the San Antonio Water System (SAWS) to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Elmendorf implement the following water supply plan (Table 5.3.2-14).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 2 acft/yr by 2050, increasing to 36 acft/yr of supply in 2070.

5.3.2.9 City of Fair Oaks Ranch

The City of Fair Oaks Ranch is projected to have adequate water supplies available from the Trinity Aquifer and Canyon Reservoir to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Fair Oaks Ranch implement the following water supply plan (Table 5.3.2-16).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 116 acft/yr by 2020, increasing to 1,407 acft/yr of supply in 2070.

Table 5.3.2-16. Recommended Water Supply Plan for the City of Fair Oaks Ranch

5.3.2.10 City of Helotes

The City of Helotes is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Helotes implement the following water supply plan (Table 5.3.2-18).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 67 acft/yr by 2020, increasing to 476 acft/yr of supply in 2070.
- Facilities Expansions (System Interconnects).

5.3.2.11 City of Hill Country Village

The City of Hill Country Village is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Hill Country Village implement the following water supply plan (Table 5.3.2-20).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 10 acft/yr by 2020, increasing to 70 acft/yr of supply in 2070.

5.3.2.13 City of Kirby

Current water supply for the City of Kirby is obtained from the Edwards Aquifer. Kirby is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Kirby implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-24).

• Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional supply of 137 acft/yr by 2020, increasing to 169 acft/yr of additional supply by 2070.

- Purchase from Wholesale Water Provider (SAWS) to be implemented prior to 2020. This strategy can provide an additional supply of 137 acft/yr by 2020, increasing to 169 acft/yr of additional supply by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional supply of 47 acft/yr by 2020.

Table 5.3.2-24. Recommended Water Supply Plan for the City of Kirby

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.2.14 Lackland AFB (CDP)

Current water supply for Lackland AFB is obtained from the Edwards Aquifer. Lackland AFB is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period.

5.3.2.15 City of Leon Valley

The City of Leon Valley obtains water supplies available from the Edwards Aquifer. Leon Valley is expected to have needs prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Leon Valley implement the following water supply plan (Table 5.3.2-26).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 55 acft/yr by 2020, increasing to 294 acft/yr in 2070.
- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional supply of 97 acft/yr by 2020, increasing to 377 acft/yr of additional supply by 2070.
- Purchase from Wholesale Water Provider (SAWS) to be implemented prior to 2020. This strategy can provide an additional supply of 97 acft/yr by 2020, increasing to 377 acft/yr of additional supply by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 93 acft/yr by 2020.

5.3.2.16 City of Live Oak

The City of Live Oak is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Live Oak implement the following water supply plan (Table 5.3.2-28).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 94 acft/yr by 2020, increasing to 440 acft/yr of supply in 2070.

Table 5.3.2-28. Recommended Water Supply Plan for the City of Live Oak

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.2.17 City of Olmos Park

The City of Olmos Park is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Olmos Park implement the following water supply plan (Table 5.3.2-30).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 21 acft/yr by 2020, increasing to 244 acft/yr of supply in 2070.

Table 5.3.2-30. Recommended Water Supply Plan for the City of Olmos Park

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.2.18 City of San Antonio / SAWS

Current water supply for the City of San Antonio / SAWS is obtained from the Edwards, Trinity, and Carrizo Aquifers, Canyon Reservoir, CRWA, SSLGC run-of-river rights, and direct reuse. San Antonio is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that San Antonio implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-32).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 15,974 acft/yr by 2020, decreasing to 2,792 acft/yr of supply in 2070.
- Purchase from WWP (SAWS) to be implemented prior to 2020. This strategy can
 provide an additional supply of 36,494 acft/yr by 2020, increasing to 178,764
 acft/yr of additional supply by 2070. See Chapter 5.4 for a list of recommended
 water management strategies.

5.3.2.19 Randolph AFB

Randolph AFB is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Randolph AFB implement the following water supply plan (Table 5.3.2-34).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 3 acft/yr by 2020, increasing to 21 acft/yr of supply in 2070.

Table 5.3.2-34. Recommended Water Supply Plan for the City of Randolph AFB

5.3.2.20 City of Selma

Current water supply for the City of Selma is obtained from the Edwards and Carrizo Aquifers and SSLGC Contract. Selma is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Selma implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-36).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 60 acft/yr by 2020, increasing to 295 acft/yr of supply in 2070.
- Purchase from WWP (SSLGC) to be implemented prior to 2020. This strategy can provide an additional 16 acft/yr of supply by 2030, increasing to 345 acft/yr by 2070.

Table 5.3.2-36. Recommended Water Supply Plan for the City of Selma

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.2.21 City of Shavano Park

Current water supply for the City of Shavano Park is obtained from the Edwards Aquifer. Shavano Park is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Shavano Park implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-38).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 67 acft/yr by 2020, increasing to 709 acft/yr of supply in 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 55 acft/yr by 2020.
- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional supply of 425 acft/yr by 2020, increasing to 1,013 acft/yr of additional supply by 2070.

Table 5.3.2-38. Recommended Water Supply Plan for the City of Shavano Park

5.3.2.22 City of Somerset

The City of Somerset is projected to have adequate water supplies available from run-ofriver rights to meet the city's projected demands during the planning period.

5.3.2.23 City of St. Hedwig

The City of St. Hedwig is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of St. Hedwig implement the following water supply plan (Table 5.3.2-40).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 3 acft/yr in 2070.

Table 5.3.2-40. Recommended Water Supply Plan for the City of St. Hedwig

5.3.2.24 Terrell Hills

The City of Terrell Hills is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Terrell Hills implement the following water supply plan (Table 5.3.2-42).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 52 acft/yr by 2020, increasing to 400 acft/yr of supply in 2070.

5.3.2.25 The Oaks WSC

Current water supply for the Oaks WSC is obtained from the SAWS and the Trinity Aquifer. The Oaks WSC is projected to need additional water supplies prior to 2040. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Shavano Park implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-44).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 15 acft/yr by 2020, increasing to 111 acft/yr of supply in 2070.
- Purchase from WWP (SAWS) to be implemented by 2020. This strategy can provide an additional 1 acft/yr by 2040, increasing to 165 acft/yr of supply in 2070.

Table 5.3.2-44. Recommended Water Supply Plan for the Oaks WSC

5.3.2.26 City of Universal City

Current water supply for the City of Universal City is obtained from the Edwards and Carrizo Aquifers. Universal City is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Universal City implement the following water supply plan to meet the projected needs for the city (Table 5.3.2-46).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 69 acft/yr by 2060, increasing to 143 acft/yr of supply in 2070.
- Purchase from WWP (SSLGC) to be implemented prior to 2020. This strategy can provide an additional 416 acft/yr of supply by 2020, decreasing to 332 acft/yr by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 160 acft/yr by 2020.

5.3.2.27 Von Ormy

The City of Von Ormy is projected to have adequate water supplies available from the Trinity Aquifer and purchases from Atascosa Rural/SAWS to meet the city's projected demands during the planning period.

5.3.2.28 Water Service Inc. (Apex)

Water Service Inc. (Apex) is projected to have adequate water supplies available from the Edwards Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Water Service Inc. implement the following water supply plan (Table 5.3.2-48).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 17 acft/yr by 2020, increasing to 95 acft/yr of supply in 2070.

Table 5.3.2-48. Recommended Water Supply Plan for Water Service Inc.

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.2.29 City of Windcrest

The City of Windcrest obtains its water supply from the Edwards Aquifer and is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Windcrest implement the following water supply plan (Table 5.3.2-50).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 51 acft/yr by 2020, increasing to 372 acft/yr of supply in 2070.
- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional 326 acft/yr by 2020 increasing to 451 acft/yr of supply in 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 60 acft/yr by 2020.

5.3.2.30 Rural Area Residential and Commercial

Current water supply for Rural Areas is obtained from the Edwards Aquifer, Trinity Aquifer, and Canyon Reservoir. Rural Areas are projected to need additional water supplies prior to 2050. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected needs for rural areas (Table 5.3.2-52).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 223 acft/yr in 2020, increasing to 3,088 acft/yr of supply in 2070.
- Purchase from WWP (SAWS) to be implemented prior to 2020. This strategy can
 provide an additional 1,898 acft/yr in 2050, increasing to 6,048 acft/yr of supply in
 2070.

Table 5.3.2-52. Re	ecommended Wate	Supply Plan	for Rural Areas
--------------------	-----------------	-------------	-----------------

Table 5.3.2-53. Recommended Plan Costs by Decade for Rural Areas

5.3.2.1 Industrial/Manufacturing

Current water supply for industrial is obtained from the Edwards Aquifer, Trinity Aquifer, run-of-river rights, and direct reuse. Industrial is projected to need additional water supplies prior to 2060. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual industrial operations implement the following water supply plan to meet the projected needs for industrial (Table 5.3.2-54).

• Purchase from WWP (SAWS) to be implemented prior to 2060. This strategy can provide an additional 1,058 acft/yr of supply in 2060, increasing to 3,680 acft/yr of additional supply in 2070. See Chapter 5.4 for an individual project list.

Table 5.3.2-54. Recommended Water Supply Plan for Industrial

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.2.2 Steam-Electric Power

Steam-electric power is projected to have adequate water supplies available from Victor Braunig Lake and Calaveras Lake to meet the water user group's projected demand during the planning period.

5.3.2.3 Mining

Current water supply for mining is obtained from the Carrizo Aquifer. Mining is projected to have adequate water supplies available.

5.3.2.4 Irrigation

Current water supply for Irrigation is obtained from the Edwards Aquifer, Carrizo Aquifer, and run-of-river rights. Irrigation is projected to need additional water supplies prior to 2020. Due to limited economically feasible supplies for irrigation, these needs remain unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual Irrigators implement the following water supply plan to meet the projected needs for Irrigation (Table 5.3.2-56).

• Irrigation Water Conservation, while not a recommended strategy, is encouraged and can provide additional supply when possible. The SCTRWPG has determined that it is not economically feasible for agricultural producers to pay for additional supplies to meet projected needs.

Table 5.3.2-56. Recommended Water Supply Plan for Irrigation

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.3 Caldwell County Water Supply Plan

Table 5.3.3-1 lists each water user group in Caldwell County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.3-1. Caldwell	County Management Supply/Shortage by Water User
Group	

		lement Shortage	and an internation of the
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment

Mining	0	0	No projected shortage
Irrigation	34	302	No projected shortage
Livestock	0	0	No projected shortage

5.3.3.1 Aqua WSC

Aqua WSC is projected to have adequate water supplies available from the Carrizo Aquifer. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Aqua WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.3-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 9 acft/yr by 2020, increasing to 66 acft/yr of supply in 2070.

Table 5.3.3-2. Recommended Water Supply Plan for Aqua WSC

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	0	0	0	0	0
Recommended Plan						
Municipal Water Conservation	9	15	22	33	48	66
Total New Supply	9	15	22	33	48	66

Estimated costs of the recommended plan to meet Aqua WSC's projected needs are shown in Table 5.3.3-3.

Table 5.3.3-3. Recommended Plan Costs by Decade for Aqua WSC

Plan Element	2020	2030	2040	2050	2060	2070
Municipal Water Conservation						
Annual Cost (\$/yr)	\$6,807	\$11,705	\$16,900	\$25,455	\$36,925	\$50,677
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.3.2 Creedmoor-Maha WSC

Creedmoor-Maha WSC is projected to have adequate water supplies available from the Edwards (Barton Springs) Aquifer.

5.3.3.3 City of Lockhart

Current water supply for the City of Lockhart is obtained from the Carrizo Aquifer and Guadalupe-Blanco River Authority run-of-river rights. Lockhart is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Lockhart implement the following water supply plan to meet the projected needs for the city (Table 5.3.3-4).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 72 acft/yr by 2070.

- Purchase from WWP (GBRA) to be implemented prior to 2020. This strategy can provide an additional 1,120 acft/yr in 2020 increasing to 2,402 acft/yr by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 113 acft/yr by 2020.

Table 5.3.3-4. Recommended Water Supply Plan for the City of Lockhart

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.3.4 City of Luling

Current water supply for the City of Luling is obtained from the Carrizo Aquifer and Guadalupe-Blanco River Authority run-of-river rights. Luling is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Luling implement the following water supply plan to meet the projected needs for the city (Table 5.3.3-6).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 3 acft/yr by 2070.
- Purchase from WWP (GBRA) to be implemented prior to 2020. This strategy can provide an additional 1,680 acft/yr from 2020 increasing to 1,875 by 2070.

Table 5.3.3-6. Recommended Water Supply Plan for the City of Luling

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.3.5 City of Martindale

The City of Martindale is obtained from run-of-river rights. The City of Martindale is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that The City of Martindale implement the following water supply plan to meet the projected needs for the City (Table 5.3.3-8).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 1 acft/yr by 2070.
- Purchase from Wholesale Water Provider (CRWA) to be implemented prior to 2030. This strategy can provide an additional supply of 31 acft/yr by 2030, increasing to 177 acft/yr of additional supply by 2070.

 Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 9 acft/yr by 2020.

5.3.3.6 Maxwell WSC

Maxwell WSC is projected to have adequate water supplies available from the Edwards Aquifer, Canyon Reservoir, and run-of-river rights through Canyon Regional Water Authority (CRWA) for the planning period.

5.3.3.7 City of Mustang Ridge

The City of Mustang Ridge is projected to have adequate water supplies available from the Carrizo Aquifer. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Mustang Ridge implement the following water supply plan (Table 5.3.3-10).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 1 acft/yr of supply in 2070.

Table 5.3.3-10. Recommended Water Supply Plan for the City of Mustang Ridge

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.3.8 Polonia WSC

Current water supply for Polonia WSC is obtained from the Carrizo Aquifer. Polonia WSC is projected to need additional water supplies prior to 2050. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Polonia WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.3-12).

• Local Wilcox Groundwater² with conversion from Irrigation sources to be implemented prior to 2050 can provide an additional 146 acft/yr by 2050, increasing to 541 acft/yr in 2070.

•

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.3.9 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Carrizo Aquifer, Queen City Aquifer, and run-of-river rights to meet their projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected needs for rural areas (Table 5.3.3-14).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 2 acft/yr by 2070.

Table 5.3.3-14. Recommended Water Supply Plan for Rural Areas

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Unit Cost (\$/acft)	_					\$770

Table 5.3.3-15. Recommended Plan Costs by Decade for Rural Areas

In addition, the Tri-Community WSC in Rural Caldwell County is considering the addition of Local Carrizo Groundwater from a new well and interconnections with Maxwell WSC and/or City of Luling.

5.3.3.10 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demands during the planning period.

5.3.3.11 Steam-Electric Power

There is no projected steam-electric power water demand in Caldwell County, therefore no water management strategies are recommended for this water user group.

5.3.3.12 Mining

Mining is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demands during the planning period.

5.3.3.13 Irrigation

Irrigation is projected to have adequate water supplies available from the Carrizo Aquifer, Queen City Aquifer, and run-of-river rights to meet the water user group's projected demands during the planning period.

5.3.3.14 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demands during the planning period.

Table 5.3.4-1 lists each water user group in Calhoun County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.4-1. Calho	oun County Managemei	nt Supply/Shortage	by Water User
Group			

		lement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
Calhoun County WSC	1,144	1,010	No projected shortage
City of Point Comfort	91	51	No projected shortage
City of Port Lavaca	2,553	1,694	No projected shortage
Port O' Connor MUD	1,210	1,168	No projected shortage
City of Seadrift	472	354	No projected shortage
Rural Area Residential and Commercial	181	64	No projected shortage
Industrial/Manufacturing *	10,388	-11,174	Projected shortage (2050 through 2070)
Steam-Electric Power	0	0	No projected shortage
Mining	3	43	No projected shortage
Irrigation	-12,273	-7,527	Projected shortage (2020 through 2070)
Livestock	0	0	No projected shortage

*These values represent the sum of the Surplus/Shortage values for each river basin and/or across the entire county. These values may differ from the Need value reported in other tables because the Need represents only the sum of the shortages.

5.3.4.1 Calhoun County WSC

Calhoun County WSC is projected to have adequate water supplies available from runof-river rights of the Guadalupe-Blanco River Authority (GBRA) to meet the WSC's projected demands during the planning period.

5.3.4.2 City of Point Comfort

The City of Point Comfort is projected to have adequate water supplies available from Lake Texana to meet the city's projected demands during the planning period.

5.3.4.3 City of Port Lavaca

The City of Port Lavaca is projected to have adequate water supplies available from runof-river rights of the Guadalupe-Blanco River Authority (GBRA) to meet the city's projected demands during the planning period

5.3.4.4 Port O' Connor MUD

Port O' Connor MUD is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period.

5.3.4.5 City of Seadrift

The City of Seadrift is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Seadrift implement the following water supply plan (Table 5.3.4-2).

• Municipal Water Conservation to be implemented or enhanced in the future. This strategy can provide an additional 6 acft/yr by 2020, increasing to 41 acft/yr of supply in 2070.

Table 5.3.4-2. Recommended Water Supply Plan for the City of Seadrift

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Recommended Plan						
Municipal Water Conservation	6	14	16	22	31	41
Total New Supply	6	14	16	22	31	41

Estimated costs of the recommended plan for the City of Seadrift are shown in Table 5.3.4-3.

Table 5.3.4-3. Recommended Plan Costs by Decade for the City of Seadrift

Plan Element	2020	2030	2040	2050	2060	2070
Municipal Water Conser	vation					
Annual Cost (\$/yr)	\$4,942	\$10,868	\$12,482	\$17,194	\$23,821	\$31,643
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.4.6 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Gulf Coast Aquifer and run-of-river rights of the Guadalupe-Blanco River Authority (GBRA) to meet their projected demands during the planning period.

5.3.4.7 Industrial/Manufacturing

Calhoun County Industrial obtains water supplies available from the Gulf Coast Aquifer, Lake Texana, and run-of-river rights of the Guadalupe-Blanco River Authority (GBRA) to meet the water user group's current demands. The following water supply plan is recommended for Calhoun County Industrial (Table 5.3.4-4).

• Purchase from WWP (GBRA) to be implemented by 2050. This strategy can provide an additional 2,161 acft by 2050 increasing to 11,174 acft/yr by 2070.

An alternative water management strategy to meet the 10,000 acft/yr of needs for Formosa Plastics could be obtained from Purchase from WWP (LNRA) to be implemented by 2020. This strategy can provide an additional 10,000 acft/yr by 2050, continuing through 2070.

Table 5.3.4-4. Recommended Water Supply Plan for Industrial

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	0	0	2,161	6,993	11,174
Recommended Plan						
Purchase from WWP (GBRA)	_			2,161	6,993	11,174
Total New Supply			-	2,161	6,393	11,174

Estimated costs of the recommended plan for Industrial are shown in Table 5.3.4-5.

Table 5.3.4-5. Recommended Plan Costs by Decade for Industrial

Plan Element	2020	2030	2040	2050	2060	2070
Purchase from WWP (GBI	RA)					
Annual Cost (\$/yr)		1. 1 <u></u> 1 - 1		\$1,502,000	\$4,743,000	\$6,654,000
Unit Cost (\$/acft)		-	_	\$695	\$678	\$596

5.3.4.8 Steam-Electric Power

Steam-electric power is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demands during the planning period.

5.3.4.9 Mining

Mining is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demands during the planning period.

5.3.4.10 Irrigation

Current water supply for Irrigation is obtained from run-of-river rights. Irrigation is projected to need additional water supplies prior to 2020. Due to limited economically feasible supplies for irrigation, these needs remain unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual Irrigators implement the following water supply plan to meet the projected needs for Irrigation (Table 5.3.4-4).

 Irrigation Water Conservation, while not a recommended strategy, is encouraged and can provide additional supply when possible. The SCTRWPG has determined that it is not economically feasible for agricultural producers to pay for additional supplies to meet projected needs.

Table 5.3.4-6. Recommended Water Supply Plan for Irrigation

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

City of New Braunfels	2,491	-14,580	Projected shortage (2020 through 2060)
City of Schertz			See Guadalupe County
City of Selma			See Bexar County
Water Service Inc.			See Bexar County
Rural Area Residential and Commercial*	814	971	No projected shortage
Industrial/Manufacturing *	-4,130	-8,074	Projected shortage (2020 through 2070)
Steam-Electric Power	0	0	No projected demand
Mining	0	0	No projected shortage
Irrigation	496	673	No projected shortage
Livestock	0	0	No projected shortage

*These values represent the sum of the Surplus/Shortage values for each river basin and/or across the entire county. These values may differ from the Need value reported in other tables because the Need represents only the sum of the shortages.

5.3.5.1 City of Bulverde

The City of Bulverde is projected to have adequate water supplies available from Canyon Reservoir and Trinity Aquifer through Canyon Lake Water Service Company to meet the water user group's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Bulverde implement the following water supply plan (Table 5.3.5-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 1 acft/yr by 2050, increasing to 71 acft/yr of supply in 2070.

Table 5.3.5-2. Recommended Water Supply Plan for the City of Bulverde

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Unit Cost (\$/acft)		<u> </u>		\$681	\$681	\$681

5.3.5.2 Canyon Lake WSC

Current water supply for Canyon Lake WSC is obtained from Canyon Reservoir and the Trinity Aquifer. Canyon Lake WSC is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Canyon Lake WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.5-4).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 75 acft/yr by 2050, increasing to 638 acft/yr of supply in 2070.
- Purchase from WWP (TWA) to be implemented prior to 2030. This strategy can provide an additional 671 acft/yr by 2030, increasing to 7,468 acft/yr in 2070.

Table 5.3.5-4. Recommended Water Supply Plan for Canyon Lake WSC

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	671	2,373	4,095	5,814	7,468

Unit Cost (\$/acft)	-			\$770	\$770	\$770
Purchase from WWP (TW)	4)					·
Annual Cost (\$/yr)		\$1,629,000	\$2,104,000	\$3,572,000	\$4,146,000	\$5,257,000
Unit Cost (\$/acft)		\$2,428	\$887	\$872	\$713	\$704

5.3.5.3 City of Garden Ridge

Current water supply for the City of Garden Ridge is obtained from the Edwards Aquifer. Garden Ridge is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Garden Ridge implement the following water supply plan to meet the projected needs for the city (Table 5.3.5-6).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 101 acft/yr by 2020, increasing to 1,941 acft/yr of supply in 2070.
- A Local Trinity Groundwater water management strategy to be implemented prior to 2020 can provide an additional 2,000 acft/yr by 2020 through 2070.
- Purchase from WWP (SSLGC) to be implemented prior to 2020. This strategy can provide an additional 150 acft/yr by 2020 through 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 83 acft/yr by 2020.

An alternative water management strategy for the City of Garden Ridge, if groundwater permits from Gonzales County are unable to be obtained, is Purchase from WWP (CRWA).

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.5.4 City of New Braunfels

Current water supply for the City of New Braunfels is obtained from the Edwards Aquifer, Canyon Reservoir, and run-of-river rights. New Braunfels is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that New Braunfels implement the following water supply plan to meet the projected needs for the city (Table 5.3.5-8).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 644 acft/yr by 2020, increasing to 8,346 acft/yr of supply in 2070.
- The NBU ASR water management strategy to be implemented prior to 2020 can provide an additional 8,300 acft/yr of new supply.
- The NBU Trinity water management strategy to be implemented prior to 2030 can provide an additional 1,090 acft/yr.
- Direct Recycled Water to be implemented before 2020. This Strategy can provide an additional supply of 7,025 acft/yr by 2020 increasing to 11,709 acft/yr by 2070.

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Table 5.3.5-9. Recommended Plan Costs by Decade for the City of New Braunfels

5.3.5.5 Rural Area Residential and Commercial

Rural Area Residential and Commercial in Comal County is expected to have adequate supply through 2070, therefore no water management strategies are recommended for this water user group.

5.3.5.6 Industrial/Manufacturing

Current water supply for industrial is obtained from the Edwards Aquifer, Canyon Reservoir, and run-of-river rights. Industrial is projected to need additional water supplies prior to the year 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual industrial operations implement the following water supply plan to meet the projected needs for industrial (Table 5.3.5-10).

- Purchase from WWP (GBRA) is to be implemented prior to 2020. This strategy can provide an additional 4,130 acft/yr of supply in 2020, increasing to 8,074 acft/yr of additional supply in 2070.
- Recycled water from NBU could also be implemented as a way to meet industrial needs in Comal County.

•

Table 5.3.5-10. Recommended Water Supply Plan for Industrial

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.5.7 Steam-Electric Power

There is no projected steam-electric power water demand in Comal County, therefore no water management strategies are recommended for this water user group.

5.3.5.8 Mining

Current water supply for mining is obtained from the Trinity Aquifer. Mining is not projected to need additional water supplies over the planning period.

5.3.5.9 Irrigation

Irrigation is projected to have adequate water supplies available from the Edwards Aquifer, Canyon Reservoir, and run-of-river rights to meet the water user group's projected demand during the planning period.

5.3.5.10 Livestock

Current water supply for livestock is obtained from the Trinity Aquifer and local sources. Livestock is projected to have adequate water supplies through 2070.

2016 South Central Texas Regional Water Plan Volume I

5.3.6 DeWitt County Water Supply Plan

Table 5.3.6-1 lists each water user group in DeWitt County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.6-1. DeWitt Count	y Management	Supply/Shortage by	Water User Group
-----------------------------	--------------	--------------------	------------------

	Management Supply/Shortage		and the second second second		
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment		
City of Cuero	1,847	2,087	No projected shortage		
Gonzales County WSC		1	See Gonzales County		
City of Yoakum	700	751	No projected shortage		
City of Yorktown	972	972	No projected shortage		
Rural Area Residential and Commercial	49	272	No projected shortage		
Industrial/Manufacturing	219	44	No projected shortage

Mining	-44	0	Projected shortage (2020 through 2050)		
Irrigation	-74	0	Projected shortage (2020 through 2050)		
Livestock	0	0	No projected shortage		

5.3.6.1 City of Cuero

The City of Cuero is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Cuero implement the following water supply plan (Table 5.3.6-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 270 acft/yr by 2020, increasing to 767 acft/yr of supply in 2070.

Table 5.3.6-2. Recommended Water Supply Plan for the City of Cuero

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Municipal Water Cons	ervation					
Annual Cost (\$/yr)	\$207,927	\$256,718	\$293,330	\$347,757	\$505,470	\$590,560
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.6.2 City of Yoakum

The City of Yoakum is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Yoakum implement the following water supply plan (Table 5.3.6-4).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 42 acft/yr by 2020, increasing to 64 acft/yr of supply in 2070.

Table 5.3.6-4. Recommended Water Supply Plan for the City of Yoakum

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.6.3 City of Yorktown

The City of Yorktown is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Yorktown implement the following water supply plan (Table 5.3.6-6).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 47 acft/yr by 2020, increasing to 59 acft/yr of supply in 2070.

Table 5.3.6-6. Recommended Water Supply Plan for the City of Yorktown

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Municipal Water Conservat	ion					
Annual Cost (\$/yr)	\$36,512	\$39,650	\$21,882	\$9,234	\$39,042	\$45,375
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.6.4 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Gulf Coast Aquifer to meet their projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan for rural areas (Table 5.3.6-8).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 40 acft/yr in 2020.

Table 5.3.6-8. Recommended Water Supply Plan for Rural Areas

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	0	0	0	0	0
Recommended Plan						
Municipal Water Conservation	40	-			-

Unit Cost (\$/acft)	\$770			e e		

5.3.6.1 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demand during the planning period.

5.3.6.2 Steam-Electric Power

There is no projected steam-electric power water demand in DeWitt County, therefore no water management strategies are recommended for this water user group.

5.3.6.3 Mining

Current water supply for Irrigation is obtained from the Gulf Coast Aquifer. Mining is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual Irrigators implement the following water supply plan to meet the projected needs for Irrigation (Table 5.3.6-10).

• Local Gulf Coast Aquifer development to be implemented by 2020. This strategy can provide an additional 44 acft/yr by 2020 through 2070.

5.3.6.4 Irrigation

Current water supply for Irrigation is obtained from the Gulf Coast Aquifer and run-ofriver rights. Irrigation is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual Irrigators implement the following water supply plan to meet the projected needs for Irrigation (Table 5.3.6-12).

Table 5.3.6-12. Recommended Water Supply Plan for Irrigation

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Table 5.3.6-13. Recommended Plan Costs by Decade for Irrigation

5.3.6.5 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

Table 5.3.7-1 lists each water user group in Dimmit County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.7-1. Dimmit County Management Supply/Sh	hortage by Water User Group
---	-----------------------------

		lement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
City of Asherton	-28	26	Projected shortage (2020 through 2050)
City of Big Wells	77	110	No projected shortage
City of Carrizo Springs	-267	100	Projected shortage (2020 through 2050)
Rural Area Residential and Commercial	-297	-184	Projected shortage (2020 through 2070)
Industrial/Manufacturing	0	0	No projected demand
Steam-Electric Power	0	0	No projected demand
Mining	-4,826	-519	Projected shortage (2020 through 2070)
Irrigation	-3,372	-2,466	Projected shortage (2020 through 2070)
Livestock	0	0	No projected shortage

5.3.7.1 City of Asherton

Current Supplies for the City of Asherton come from the Carrizo Aquifer. The city of Asherton is projected to need additional water supplies from 2020 through 2050. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Carrizo Springs implement the following water supply plan (Table 5.3.7-2):

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 82 acft/yr by 2020, increasing to 123 acft/yr of supply in 2050 then decreasing to 72 acft/yr of supply in 2070.
- Local Carrizo Groundwater³ could be implemented; however the MAG limits availability within Carrizo Aquifer in Dimmit County.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 17 acft/yr by 2020.

Table 5.3.7-2. Recommended	Water Supply Plar	n for the City of	Asherton
----------------------------	-------------------	-------------------	----------

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.7.2 City of Big Wells

The City of Big Wells is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Big Wells implement the following water supply plan (Table 5.3.7-4).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 41 acft/yr by 2020, decreasing to 11 acft/yr of supply in 2070.

Table 5.3.7-4. Recommended Water Supply Plan for the City of Big Wells

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.7.3 City of Carrizo Springs

Current Supplies for the City of Carrizo Springs come from the Carrizo Aquifer. The City of Carrizo Springs is projected to need additional water supplies from 2020 through 2050. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Carrizo Springs implement the following water supply plan (Table 5.3.7-6).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 267 acft/yr by 2020, increasing to 578 acft/yr of supply in 2050.
- Local Carrizo Groundwater⁴ could be implemented; however the MAG limits availability within Carrizo Aquifer in Dimmit County.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 114 acft/yr by 2020.

Table 5.3.7-6. Recommended Water Supply Plan for the City of Carrizo Springs

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Unit Cost (\$/acft)	\$1,205					

5.3.7.4 Rural Area Residential and Commercial

Current water supply for Rural Areas is obtained from the Carrizo Aquifer. Rural Areas are projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected needs for rural areas (Table 5.3.7-8).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 109 acft/yr in 2020 decreasing to 5 acft/yr of supply by 2070.
- Conversion of Irrigation surface water rights could provide an additional 297 acft/yr of supply in 2020 decreasing to 184 acft/yr in 2070.

Table 5.3.7-8. Recommended Water Supply Plan for Rural Areas

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Unit Cost (\$/acft)	\$2,876	\$2,876	\$1,244	\$1,244	\$1,244	\$1,244

5.3.7.1 Industrial/Manufacturing

There is no projected industrial water demand in Dimmit County, therefore no water management strategies are recommended for this water user group.

5.3.7.2 Steam-Electric Power

There is no projected steam-electric power water demand in Dimmit County, therefore no water management strategies are recommended for this water user group.

5.3.7.3 Mining

Current water supply for Mining is obtained from the Carrizo Aquifer and run-of-river rights. Mining is projected to need additional water supplies prior to 2020. Due to a lack of supply in the county, these needs remain unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual mining companies implement the following water supply plan to meet the projected needs for Mining (Table 5.3.7-10).

• Mining Water Conservation to be implemented prior to 2020. Actual needs reduced could vary greatly.

Table 5.3.7-10. Recommended Water Supply Plan for Mining

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	4,826	4,908	4,244	2,731	1,222	519
Recommended Plan						
Mining Water Conservation	ND	ND	ND	ND	ND	ND
Total New Supply						

5.3.7.4 Irrigation

Current water supply for Irrigation is obtained from the Carrizo Aquifer and run-of-river rights. Irrigation is projected to need additional water supplies prior to 2020. Due to limited economically feasible supplies for irrigation, these needs remain unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual Irrigators implement the following water supply plan (Table 5.3.7-11).

 Irrigation Water Conservation, while not a recommended strategy, is encouraged and can provide additional supply when possible. The SCTRWPG has determined that it is not economically feasible for agricultural producers to pay for additional supplies to meet projected needs.

Table 5.3.7-11. Recommended Water Supply Plan for Irrigation

2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Mining	0	0	No projected shortage
Irrigation	0	0	No projected shortage
Livestock	0	0	No projected shortage

5.3.8.1 City of Dilley

The City of Dilley is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Dilley implement the following water supply plan (Table 5.3.8-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 48 acft/yr by 2020, increasing to 470 acft/yr of supply in 2070.

Table 5.3.8-2. Recommended Water Supply Plan for the City of Dilley

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.8.2 City of Pearsall

The City of Pearsall is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Pearsall implement the following water supply plan (Table 5.3.8-4).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 81acft/yr by 2020, increasing to 655 acft/yr of supply in 2070.
- A Local Carrizo Groundwater⁵ conversion from Irrigation sources to be implemented prior to 2070 can provide an additional 20 acft/yr.

⁵ See Chapter 8.3.1, Recommendation #6 5.3-74 | December 2015

Estimated costs of the recommended plan for the City of Pearsall are shown in Table 5.3.8-5.

Table 5.3.8-5. Recommended Plan Costs by Decade for the City of Pearsall

Plan Element	2020	2030	2040	2050	2060	2070
Municipal Water Conserv	ation					
Annual Cost (\$/yr)	\$55,279	\$168,525	\$295,294	\$338,413	\$390,470	\$446,287
Unit Cost (\$/acft)	\$681	\$681	\$681	\$681	\$681	\$681
Local Carrizo Conversion		1				
Annual Cost (\$/yr)	-			-		\$103,000
Unit Cost (\$/acft)		-				\$5,000

5.3.8.3 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Carrizo Aquifer to meet their projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan for rural areas (Table 5.3.8-6).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 2 acft/yr in 2070.

Table 5.3.8-6. Recommended Water Supply Plan for Rural Areas

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	0	0	0	0	0
Recommended Plan						
Municipal Water Conservation			-	-		2
Total New Supply		-	-			2

Estimated costs of the recommended plan for rural areas are shown in Table 5.3.8-7.

Table 5.3.8-7. Recommended Plan Costs by Decade for Rural Areas

Plan Element	2020	2030	2040	2050	2060	2070
Municipal Water Conservatio	n					
Annual Cost (\$/yr)	_		_	_	-	\$1,791
Unit Cost (\$/acft)			-	_		\$770

5.3.8.1 Industrial/Manufacturing

There is no projected industrial water demand in Frio County, therefore no water management strategies are recommended for this water user group.

5.3.8.2 Steam-Electric Power

Steam-electric power is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demand during the planning period.

5.3.8.3 Mining

Mining is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demand during the planning period.

5.3.8.4 Irrigation

Irrigation is projected to have adequate water supplies available from the Carrizo Aquifer, Queen City Aquifer, Sparta Aquifer, and run-of-river rights to meet the water user group's projected demand during the planning period.

5.3.8.5 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

5.3.9 Goliad County Water Supply Plan

Table 5.3.9-1 lists each water user group in Goliad County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.9-1. Goliad County	Management	Supply/Shortage	by Water Use	r Group
Tubic 0.0.0 T. donad obanty	munugement	ouppiy/ononlage	by water ose	aloup

		ement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
City of Goliad	193	253	No projected shortage
Rural Area Residential and Commercial	177	302	No projected shortage
Industrial/Manufacturing	88	0	No projected shortage
Steam-Electric Power	9,880	9,880	No projected shortage
Mining	0	0	No projected shortage
Irrigation	975	975	No projected shortage
Livestock	0	0	No projected shortage

5.3.9.1 City of Goliad

The City of Goliad is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Goliad implement the following water supply plan (Table 5.3.9-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 174 acft/yr by 2020, increasing to 133 acft/yr of supply in 2070.

Table 5.3.9-2. Recommended Water Supply Plan for the City of Goliad

a had a second a second a second	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr

5.3.9.2 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Gulf Coast Aquifer to meet their projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan for rural areas (Table 5.3.9-4).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 221 acft/yr in 2020 decreasing to 0 acft/yr of supply in 2070.

Table 5.3.9-4. Recommended Water Supply Plan for Rural Areas

5.3.9.1 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demand during the planning period.

5.3.9.2 Steam-Electric Power

Current water supply for steam-electric power is obtained from the Gulf Coast Aquifer and Coleto Creek Reservoir. Steam-electric power is projected to have adequate supplies through the planning period.

5.3.9.3 Mining

Mining is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demand during the planning period.

5.3.9.4 Irrigation

Irrigation is projected to have adequate water supplies available from the Gulf Coast Aquifer and run-of-river rights to meet the water user group's projected demand during the planning period.

5.3.9.5 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

5.3.10 Gonzales County Water Supply Plan

Table 5.3.10-1 lists each water user group in Gonzales County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.10-1. Gonzales County Management Supply/Shortage	ge by Water User
Group	

		rement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
City of Gonzales	385	-310	Projected shortage (2050 through 2070)
Gonzales County WSC	531	-63	Projected shortage (2050 & 2070)
City of Nixon	2,209	2,059	No projected shortage
City of Smiley	89	48	No projected shortage
City of Waelder	373	305	No projected shortage
Rural Area Residential and Commercial	150	45	No projected shortage
Industrial/Manufacturing	716	71	No projected shortage
Steam-Electric Power	0	0	No projected demand
Mining	0	0	No projected shortage
Irrigation	1,190	2,410	No projected shortage
Livestock	0	0	No projected shortage

5.3.10.1 City of Gonzales

The City of Gonzales obtains its supply from the Carrizo Aquifer and run-of-river rights. The city is projected to have a shortage beginning in 2050. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Gonzales implement the following water supply plan (Table 5.3.10-2).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 183 acft/yr by 2020, increasing to 1,035 by 2070.
- Local Carrizo Groundwater⁶ to be implemented by 2050. This strategy can provide an additional 310 acft/yr by 2050 through 2070.

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Unit Cost (\$/acft)		- 13		\$771	\$771	\$232

5.3.10.2 Gonzales County WSC

Current water supply for Gonzales County WSC is obtained from the Carrizo Aquifer and Canyon Reservoir. Gonzales County WSC is projected to have a shortage in 2050 and 2070. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Gonzales County WSC implement the following water supply plan (Table 5.3.10-4).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 281 acft/yr by 2020, increasing to 1,140 acft/yr of supply in 2070.
- Local Carrizo Groundwater⁷ to be implemented by 2050. This strategy can provide an additional 75 acft/yr by 2050 through 2070.
- Facilities Expansions (System Interconnects)

•

5.3.10.3 City of Nixon

The City of Nixon is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Nixon implement the following water supply plan (Table 5.3.10-6).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 21 acft/yr by 2060, increasing to 37 acft/yr of supply in 2070.

Table 5.3.10-6. Recommended Water Supply Plan for the City of Nixon

5.3.10.1 City of Smiley

The City of Smiley is projected to have adequate water supplies available from the Carrizo-Wilcox Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Smiley implement the following water supply plan (Table 5.3.10-8).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 11 acft/yr by 2020, increasing to 43 acft/yr of supply in 2070.

5.3.10.2 City of Waelder

The City of Waelder is projected to have adequate water supplies available from the Queen City Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Waelder implement the following water supply plan (Table 5.3.10-10).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 16 acft/yr by 2020, increasing to 42 acft/yr of supply in 2070.

Table 5.3.10-10. Recommended Water Supply Plan for the City of Waelder

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Municipal Water Conserva	ntion					
Annual Cost (\$/yr)	\$12,118	\$17,002	\$15,737	\$18,166	\$25,460	\$32,271
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.10.3 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Carrizo Aquifer to meet their projected demands during the planning period.

5.3.10.4 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Carrizo Aquifer and Sparta Aquifer to meet the water user group's projected demand during the planning period.

5.3.10.5 Steam-Electric Power

There is no projected steam-electric power water demand in Gonzales County, therefore no water management strategies are recommended for this water user group.

5.3.10.6 Mining

Mining is projected to have adequate water supplies available from the Carrizo Aquifer, Sparta Aquifer, and Queen City Aquifer to meet the water user group's projected demand during the planning period.

5.3.10.7 Irrigation

Irrigation is projected to have adequate water supplies available from the Carrizo Aquifer, Sparta Aquifer, Queen City Aquifer, Gulf Coast Aquifer, Canyon Reservoir, and run-ofriver rights to meet the water user group's projected demand during the planning period.

5.3.10.8 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

FR

Table 5.3.11-1 lists each water user group in Guadalupe County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.11-1. Guadalupe County Mana	agement Supply/Shortage by Water User
Group	

	Manag Supply/S					
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment			
City of Cibolo	-1,417	-9,149	Projected shortage (2020 through 2070)			
Crystal Clear WSC	341	-2,023	Projected shortage (2030 through 2070)			
East Central SUD			See Bexar County			
Green Valley SUD	-82	-1,391	Projected shortage (2020 through 2070)			
City of Marion	168	27	No projected shortage			
Martindale WSC			See Caldwell County			
City of New Berlin	0	0	No projected shortage			
City of New Braunfels			See Comal County			
Santa Clara	39	-55	Projected shortage (2050 through 2070

Mining	0	0	No projected shortage			
Irrigation	549	678	No projected shortage			
Livestock	0	0	No projected shortage			

values may differ from the Need value reported in other tables because the Need represents only the sum of the shortages.

5.3.11.1 City of Cibolo

Current water supply for the City of Cibolo is obtained from Canyon Reservoir through CRWA. The City is projected to have a shortage beginning in 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Cibolo implement the following water supply plan (Table 5.3.11-2).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 48 acft/yr by 2040, increasing to 975 acft/yr of supply in 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 267 acft/yr by 2020
- Purchase from WWP (CRWA) to be implemented prior to 2020. This strategy can provide an additional 1,781 acft/yr for 2020 through 2070.
- Purchase from WWP (CVLGC) to be implemented prior to 2030. This strategy utilizes new Carrizo supply and can provide an additional 2,116 acft/yr by 2030, increasing to 5,196 acft/yr of supply in 2070.
- Purchase from Green Valley SUD to be implemented prior to 2060. This strategy can provide an additional 870 by 2060 increasing to 2,172 by 2070.

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.11.2 Crystal Clear WSC

Current water supply for Crystal Clear WSC is obtained from the Edwards Aquifer, Canyon Reservoir, and run-of-river rights. Crystal Clear WSC is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Crystal Clear WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.11-4).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 82 acft/yr by 2070.
- Purchase from WWP (CRWA) to be implemented prior to 2020 can provide an additional 800 acft/yr by 2020, increasing to 2,280 by 2070.

Alternative water management strategies identified by Crystal Clear WSC include Local groundwater supplies, Brackish Edwards, and/or Purchase from WWP (GBRA).

Table 5.3.11-4. Recommended Water Supply Plan for Crystal Clear WSC

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Unit Cost (\$/acft)	\$1,167	\$1,513	\$1,188	\$731	\$743	\$743

5.3.11.3 Green Valley SUD

Current water supply for Green Valley SUD is obtained from the Edwards Aquifer and Canyon Reservoir. Green Valley SUD is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Green Valley SUD implement the following water supply plan to meet the projected needs for the SUD (Table 5.3.11-6).

- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 91 acft/yr by 2020.
- Purchase from WWP (CRWA) to be implemented by 2020 and can provide an additional 3,490 acft/yr in 2020 increasing to 13,490 acft/yr in 2070.

Alternative water management strategies identified by Green Valley SUD include Purchase from WWP (GBRA).

Table 5.3.11-6. Recommended Water Supply Plan for Green Valley SUD

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	82	297	533	796	1,095	1,391

5.3.11.4 City of Marion

Current water supply for the City of Marion is obtained from the Edwards Aquifer and Canyon Reservoir through CRWA. Marion is not projected to need additional water supplies throughout the planning period.

5.3.11.5 City of New Berlin

Current water supply for the City of New Berlin is purchased from East Central SUD. The City of New Berlin is not projected to need additional water supplies during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Marion implement the following water supply plan (Table 5.3.11-8).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 4 acft/yr by 2020, increasing to 24 acft/yr of supply in 2070.

Table 5.3.11-8. Recommended Water Supply Plan for the City of New Berlin

5.3.11.6 City of Santa Clara

Current water supply for the City of Santa Clara is obtained from the Carrizo Aquifer via Green Valley SUD. Santa Clara is projected to need additional water supplies by 2050. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Santa Clara implement the following water supply plan. (Table 5.3.11-10).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 1 acft/yr by 2070.
- Increase purchase from Green Valley SUD to be implemented prior to 2050. This strategy can provide an additional 15 acft/yr by 2050, increasing to 55 acft/yr of supply in 2070.

Table 5.3.11-10. Recommended Water Supply Plan for the City of Santa Clara

5.3.11.7 City of Schertz

Current water supply for the City of Schertz is obtained from the Edwards Aquifer and Carrizo Aquifer. Schertz is projected to need additional water supplies prior to 2040. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Schertz implement the following water supply plan to meet the projected needs for the city (Table 5.3.11-12).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 240 acft/yr by 2020, increasing to 1,935 acft/yr of supply in 2070.
- Purchase from WWP (SSLGC) to be implemented prior to 2020. This strategy utilizes new Carrizo supply and can provide an additional 501 acft/yr by 2020, increasing to 3,634 acft/yr of supply in 2070.
- Purchase from WWP (CVLGC) to be implemented prior to 2060. This strategy utilizes new Carrizo supply and can provide an additional 2,235 acft/yr by 2060, increasing to 4,804 acft/yr of supply in 2070.

Table 5.3.11-12. Recommended Water Supply Plan for the City of Schertz

5.3.11.8 City of Seguin

The City of Seguin is projected to have adequate water supplies available from the Carrizo Aquifer, Canyon Reservoir, and run-of-river rights to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Seguin implement the following water supply plan (Table 5.3.11-14).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 65 acft/yr by 2050, increasing to 491 acft/yr of supply in 2070.

Alternative water management strategies identified by City of Seguin include Purchase from WWP (SSLGC), Purchase from WWP (GBRA), and/or Purchase from WWP (TWA).

Table 5.3.11-14. Recommended Water Supply Plan for the City of Seguin

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.11.9 Springs Hill WSC

Springs Hill WSC is projected to have adequate water supplies available from the Carrizo Aquifer and Canyon Reservoir to meet the WSC's projected demands during the planning period.

5.3.11.10 Rural Area Residential and Commercial

Current water supply for Rural Areas is obtained from the Edwards Aquifer, Carrizo Aquifer, Queen City Aquifer, Canyon Reservoir, and run-of-river rights. Rural Areas are projected to have adequate water supplies through 2070. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan (Table 5.3.11-16).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 27 acft/yr in 2060 increasing to 79 acft/yr in 2070.

Table 5.3.11-16. Recommended Water Supply Plan for Rural Areas

5.3.11.11 Industrial/Manufacturing

Current water supply for industrial is obtained from the Edwards Aquifer, Carrizo Aquifer, Canyon Reservoir, and run-of-river rights. Industrial is projected to need additional water supplies prior to the year 2050. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual industrial operations implement the following water supply plan to meet the projected needs for industrial (Table 5.3.11-18).

 Purchase from WWP (GBRA) is to be implemented prior to 2050. This strategy can provide an additional 163 acft/yr of supply in 2050, increasing to 854 acft/yr of additional supply in 2070.

Table 5.3.11-18. Recommended Water Supply Plan for Industrial

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Annual Cost (\$/yr)		<u> </u>	-	\$695	\$678	\$596
Unit Cost (\$/acft)			- <u>-</u> -	\$113,000	\$335,000	\$509,000

5.3.11.12 Steam-Electric Power

Current water supply for steam-electric power is obtained from Canyon Reservoir and direct reuse. Steam-electric power is projected to have adequate water supplies through 2070.

5.3.11.13 Mining

Mining is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demand during the planning period.

5.3.11.14 Irrigation

Irrigation is projected to have adequate water supplies available from the Carrizo Aquifer, Canyon Reservoir, and run-of-river rights to meet the water user group's projected demand during the planning period.

5.3.11.15 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

This page intentionally left blank.

FX

Table 5.3.12-1 lists each water user group in Hays County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.12-1. Hays Count	/ Management Supply/Shortage b	y Water User Group

5.3.12.1 City of Buda

The City of Buda is projected to have adequate water supplies available from the GBRA to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Buda implement the following water supply plan (Table 5.3.12-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 14 acft/yr by 2020, increasing to 196 acft/yr of supply in 2070.

Table 5.3.12-2. Recommended Water Supply Plan for the City of Buda

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.12.2 County Line WSC

Current water supply for County Line WSC is obtained from the Edwards Aquifer, Canyon Reservoir, and run-of-river rights. County Line WSC is projected to need additional water supplies prior to 2040. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that County Line WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.12-4).

- Purchase from WWP (CRWA) to be implemented prior to 2020. This strategy can provide an additional 78 acft/yr by 2040, increasing to 641 acft/yr by 2070.
- Reuse can be purchased from the City of Kyle and could supply 50 acft/yr starting in 2020.

Alternative water management strategies identified by County Line WSC include Brackish Barton Springs Edwards.

Table 5.3.12-4. Recommended Water Supply Plan for County Line WSC

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.12.3 Goforth WSC

Current water supply for Goforth WSC is obtained from the Edwards (Barton Springs) Aquifer. Goforth WSC is projected to need additional water supplies prior to 2070. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Goforth WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.12-6).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 2 acft/yr by 2070.
- Purchase from WWP (GBRA) to be implemented prior to 2070. This strategy can provide an additional 525 acft/yr by 2070.

Table 5.3.12-6. Recommended Water Supply Plan for Goforth WSC

5.3.12.4 City of Kyle

Current water supply for the City of Kyle is obtained from the Edwards Aquifer, Edwards (Barton Springs) Aquifer, and Canyon Reservoir. City of Kyle is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Kyle implement the following water supply plan to meet the projected needs for the city (Table 5.3.12-8).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 53 acft/yr by 2050, increasing to 480 acft/yr of supply in 2070.
- Hays/Caldwell PUA Project⁸ to be implemented prior to 2030. This strategy can provide an additional supply of 1,348 acft/yr by 2030, increasing to 2,783 acft/yr by 2070.
- Direct Recycle Programs to be implemented before 2020 can provide an additional supply of 2,329 acft/yr by 2020 increasing to 4,063 by 2070.

An alternative water management strategy for the City of Kyle, if groundwater permits from Gonzales County are unable to be obtained, is Purchase from WWP (GBRA).

5.3.12.5 City of Mountain City

Current water supply for the City of Mountain City is obtained from the Edwards (Barton Springs) Aquifer. Mountain City is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Mountain City implement the following water supply plan to meet the projected needs for the city (Table 5.3.12-10).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 1 acft/yr by 2070.
- Local Trinity Groundwater⁹ to be implemented by 2020 can provide an additional 60 acft/yr by 2020, continuing through 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 1 acft/yr by 2020.

Table 5.3.12-10. Recommended Water Supply Plan for the City of Mountain City

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.12.6 City of Niederwald

Current water supply for the City of Niederwald is obtained from the Edwards (Barton Springs) Aquifer. Niederwald is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Niederwald implement the following water supply plan to meet the projected needs for the city (Table 5.3.12-12).

• Purchase from WWP (GBRA) to be implemented prior to 2020. This strategy can provide an additional 62 acft/yr by 2020, increasing to 203 acft/yr of supply in 2070.

 Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 4 acft/yr by 2020.

5.3.12.7 Plum Creek Water Company

Plum Creek Water Company obtains water supplies from the Edwards (Barton Springs) Aquifer. Plum Creek Water Company is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Niederwald implement the following water supply plan to meet the projected needs for the city (Table 5.3.12-14).

• Local Trinity Groundwater to be implemented by 2030 can provide an additional 185 acft/yr by 2030, continuing through 2070.

Table 5.3.12-14. Recommended Water Supply Plan for the City of Plum Creek WC

5.3.12.8 City of San Marcos

Current water supply for the City of San Marcos is obtained from the Edwards Aquifer, Canyon Reservoir, and run-of-river rights. San Marcos is projected to need additional water supplies prior to 2050. San Marcos provides potable water to the Texas State University-San Marcos. Texas State University –San Marcos is projected to need additional supply by 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that San Marcos implement the following water supply plan to meet the projected needs for the city (Table 5.3.12-16).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 179 acft/yr by 2020, increasing to 3,588 acft/yr of supply in 2070.
- Direct Recycle Programs to be implemented prior to 2020 for both San Marcos and Texas State University-San Marcos can provide an additional 1,932 acft/yr by 2020, increasing to by 8,341 2070.
- Purchase from WWP (HCPUA)¹⁰ to be implemented prior to 2050 can provide an additional 1,965 acft/yr by 2050, increasing to 7,891 by 2070.
- Purchase from WWP (GBRA) to be implemented for Texas State University-San Marcos prior to 2040 can provide an additional 2,380 acft/yr by 2040, increasing to 5,717 by 2070.

5.3.12.9 City of Uhland

The City of Uhland is projected to have adequate water supplies available from County Line SUD to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Uhland implement the following water supply plan (Table 5.3.12-18).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 5 acft/yr by 2020, increasing to 19 acft/yr of supply in 2070.

Table 5.3.12-18. Recommended Water Supply Plan for the City of Uhland

5.3.12.10 City of Wimberley

Current water supply for the City of Wimberley is obtained from the Trinity Aquifer. Wimberley WSC is projected to need additional water supplies prior to 2040. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Wimberley implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.12-20).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 10 acft/yr by 2020, increasing to 272 acft/yr of supply in 2070.
- Purchase from WWP (GBRA) to be implemented prior to 2070. This strategy can provide an additional 933 acft/yr of supply in 2070.
- Purchase from WWP (TWA) to be implemented prior to 2070. This strategy can provide 213 acft/yr of supply in 2070.

5.3.12.11 Wimberley WSC

Current water supply for Wimberley WSC is obtained from the Trinity Aquifer. Wimberley WSC is projected to need additional water supplies prior to 2040. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Wimberley implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.12-22).

- Purchase from WWP (GBRA) to be implemented prior to 2070. This strategy can provide an additional 1,123 acft/yr of supply in 2070.
- Purchase from WWP (TWA) to be implemented prior to 2070. This strategy can provide 233 acft/yr of supply in 2070.

5.3.12.12 City of Woodcreek

The City of Woodcreek is projected to have adequate supplies from the Trinity Aquifer to meet needs through the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Woodcreek implement the following water supply plan (Table 5.3.12-24).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 10 acft/yr by 2020, increasing to 76 acft/yr of supply in 2070.

5.3.12.13 Rural Area Residential and Commercial

Current water supply for Rural Areas is obtained from the Edwards Aquifer and Trinity Aquifer. Rural Areas are projected to need additional water supplies by 2050. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts, authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan (Table 5.3.12-26).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 354 acft/yr by 2070.
- Purchase from WWP (GBRA) to be implemented prior to 2060. This strategy can provide an additional 2,029 acft/yr of supply in 2060 and 7,220 acft/yr of additional supply in 2070.
- Purchase from WWP (TWA) to be implemented prior to 2050. This strategy can provide 1,169 acft/yr of supply in 2050, increasing to 4,388 acft/yr in 2070.
- Purchase from WWP (SAWS) to be implemented prior to 2020. This strategy can provide 3,781 acft/yr of supply in 2020 and 5,000 acft/yr in all decades thereafter. This supply would be part of the Vista Ridge project and additional transmission pipelines are recommended for Hays County-Other to convey this water to users within the County.

Alternative water management strategies identified by Rural Hays County include Hays/Caldwell PUA Project, and/or Rainwater Harvesting.

5.3.12.14 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Edwards Aquifer and run-of-river rights to meet the water user group's projected demand during the planning period.

5.3.12.15 Steam-Electric Power

Current water supply for steam-electric power is obtained from Canyon Reservoir and reclaimed water. Steam-electric power is projected to have adequate water supplies available during the Planning Period.

5.3.12.16 Mining

Current water supply for mining is obtained from the Trinity Aquifer. Mining is projected to have adequate water supplies available during the planning period.

5.3.12.17 Irrigation

Irrigation is projected to have adequate water supplies available from the Edwards Aquifer and run-of-river rights to meet the water user group's projected demand during the planning period.

5.3.12.18 Livestock

Current water supply for livestock is obtained from the Trinity Aquifer and local sources. Livestock is projected to have adequate water supplies through 2070.

This page intentionally left blank.

Table 5.3.13-1 lists each water user group in Karnes County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.13-1. Karnes County Management Supply/Shortage by Water	r User
Group	

		gement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment

5.3.13.1 El Oso WSC

El Oso WSC is projected to have adequate water supplies available from the Carrizo Aquifer to meet the WSC's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that El Oso WSC implement the following water supply plan (Table 5.3.13-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 49 acft/yr by 2020, increasing to 137 acft/yr of supply in 2070.

5.3.13.2 City of Falls City

The City of Falls City is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Falls City implement the following water supply plan (Table 5.3.13-4).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 10 acft/yr by 2020, increasing to 43 acft/yr of supply in 2070.

Table 5.3.13-4. Recommended Water Supply Plan for the City of Falls City

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Annual Cost (\$/yr)	\$7,617	\$16,623	\$22,787	\$29,306	\$30,870	\$32,791
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.13.3 City of Karnes City

The City of Karnes City obtains its water supply from the Carrizo Aquifer and is projected to have a shortage prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Karnes City implement the following water supply plan (Table 5.3.13-6).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 48 acft/yr in 2020, increasing to 112 acft/yr in 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 31 acft/yr by 2020.
- Local Carrizo-Wilcox/Yegua Jackson Groundwater¹¹ Conversion (Mining) to be implemented prior to 2020. This strategy can provide an additional 336 acft/yr in 2020 decreasing to 249 acft/yr in 2070 to meet needs in Karnes City while increasing the need for Karnes County Mining.

Table 5.3.13-6. Recommended Water Supply Plan for the City of Karnes City

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.13.4 City of Kenedy

Current water supply for the City of Kenedy is obtained from the Gulf Coast Aquifer. Kenedy is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Kenedy implement the following water supply plan to meet the projected needs for the city (Table 5.3.13-8).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 145 acft/yr by 2020, increasing to 568 acft/yr of supply in 2070.
- Local Gulf Coast Groundwater to be implemented prior to 2020 can provide an additional 190 acft/yr by 2040, through 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 71 acft/yr by 2020. An alternative water management strategy identified by the City of Kenedy is obtaining surface water rights from the San Antonio River.

Table 5.3.13-8. Recommended Water Supply Plan for the City of Kenedy

5.3.13.5 City of Runge

The City of Runge is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Runge implement the following water supply plan (Table 5.3.13-10).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 19 acft/yr by 2020, increasing to 54 acft/yr of supply in 2070.

Table 5.3.13-10. Recommended Water Supply Plan for the City of Runge

5.3.13.6 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Carrizo Aquifer and the Gulf Coast Aquifer to meet their projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected needs for rural areas (Table 5.3.13-12).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 7 acft/yr by 2020, increasing to 29 acft/yr of supply in 2070.

Table 5.3.13-12. Recommended Water Supply Plan for Rural Areas

5.3.13.7 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demand during the planning period.

5.3.13.8 Steam-Electric Power

There is no projected steam-electric power water demand in Karnes County, therefore no water management strategies are recommended for this water user group.

5.3.13.9 Mining

Current water supply for Mining is obtained from the Carrizo Aquifer and Gulf Coast Aquifer. Mining is projected to need additional water supplies prior to 2020. Due to a lack of supply in the county, these needs remain unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual mining companies implement the following water supply plan to meet the projected needs for Mining (Table 5.3.13-14).

Mining Water Conservation to be implemented prior to 2020. Actual needs . reduced could vary greatly.

Table 5.3.13-14. Recommended Water Supply Plan for Mining

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	1,864	1,292	700	115	0	0
Recommended Plan						
Mining Water Conservation	ND	ND	ND	ND	ND	ND
Total New Supply			_	_		-

5.3.13.10 Irrigation

Irrigation is projected to have adequate water supplies available from the Gulf Coast Aquifer and run-of-river rights to meet the water user group's projected demand during the planning period.

5.3.13.11 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

5.3.14 Kendall County Water Supply Plan

Table 5.3.14-1 lists each water user group in Kendall County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.14-1. Kendall County Management Supply/Shortage by Water User Group

		ement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
City of Boerne	2,159	-2,613	Projected shortage (2050 through 2070)
City of Fair Oaks Ranch			See Bexar County
Water Service Inc.		The local fill	See Bexar County
Kendall County WCID #1	472	244	No projected shortage
Rural Area Residential and Commercial*	5,427	5,427	No projected shortage
Industrial/Manufacturing	0	0	No projected demand
Steam-Electric Power	0	0	No projected demand
Mining	0	0	No projected shortage
Irrigation	28	84	No projected shortage
Livestock	0	9	No projected shortage

values may differ from the Need value reported in other tables because the Need represents only the sum of the shortages.

5.3.14.1 City of Boerne

Current water supply for the City of Boerne is obtained from the Trinity Aquifer, Canyon Reservoir, and Boerne Lake. Boerne is projected to need additional water supplies prior to 2040. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Boerne implement the following water supply plan to meet the projected needs for the city (Table 5.3.14-2).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 136 acft/yr by 2020, increasing to 2,294 acft/yr of supply in 2070.
- Local Trinity Groundwater to be implemented prior to 2050 can provide an additional 1000 acft/yr by 2050, through 2070.

• Western Canyon WTP Expansion to be implemented can provide an additional 639 acft/yr in 2060, increasing to 1,613 acft/yr by 2070.

Table 5.3.14-2. Recommended Water Supply Plan for the City of Boerne

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.14.2 Kendall County WCID #1

Kendall County WCID #1 is projected to have adequate water supplies available from the Trinity Aquifer and Reuse to meet the WCID's projected demands during the planning period.

5.3.14.3 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Edwards-Trinity Aquifer, Trinity Aquifer, and Canyon Reservoir during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan (Table 5.3.14-4).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 13 acft/yr in 2070.

Table 5.3.14-4. Recommended Water Supply Plan for Rural Areas

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Annual Cost (\$/yr)	-	_		-	-	\$9,900
Unit Cost (\$/acft)	-	<u> </u>				\$770

5.3.14.4 Industrial/Manufacturing

There is no projected industrial water demand in Kendall County, therefore no water management strategies are recommended for this water user group.

5.3.14.5 Steam-Electric Power

There is no projected steam-electric power water demand in Kendall County, therefore no water management strategies are recommended for this water user group.

5.3.14.6 Mining

Mining is projected to have adequate water supplies available from the Trinity Aquifer to meet the water user group's projected demand during the planning period.

5.3.14.7 Irrigation

Current water supply for irrigation is obtained from the Trinity Aquifer and run-of-river rights. Irrigation is projected to have adequate water supplies through 2070.

•

5.3.14.8 Livestock

Current water supply for livestock is obtained from the Trinity Aquifer and local sources. Livestock is projected to have adequate water supply through 2070.

Table 5.3.15-1 lists each water user group in LaSalle County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.15-1. La Salle County Management Supply/Shorta	ge by Water User
Group	

		ement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment

Livestock	0	0	No projected shortage

5.3.15.1 City of Cotulla

Current water supply for The City of Cotulla is obtained from the Carrizo Aquifer. The City of Cotulla is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected needs for rural areas (Table 5.3.15-2).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 531 acft/yr by 2050, increasing to 721 acft/yr in 2070.
- Local Carrizo Groundwater¹² with Conversion from Mining to be implemented prior to 2030. This strategy can provide an additional 16 acft/yr in 2030 increasing to 323 acft/yr in 2070 to meet needs in Cotulla while increasing the need for Cotulla County Mining.

5.3.15.2 City of Encinal

The City of Encinal is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Encinal implement the following water supply plan (Table 5.3.15-4).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 58 acft/yr by 2020, increasing to 63 acft/yr of supply in 2070.

•

5.3.15.3 Rural Area Residential and Commercial

Current water supply for Rural Areas is obtained from the Carrizo Aquifer. Rural Areas are projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected needs for rural areas (Table 5.3.15-6).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 107 acft/yr by 2020, decreasing to 5 acft/yr in 2070.
- Local Carrizo Groundwater¹³ with Conversion (Mining) to be implemented prior to 2020. This strategy can provide an additional 22 acft/yr in 2020 increasing to 133 acft/yr in 2050 to meet needs in rural areas while increasing the need for Cotulla County Mining.

Unit Cost (\$/acft)	\$1,569	\$1,569	\$677	\$677	\$677	\$677

5.3.15.4 Industrial/Manufacturing

There is no projected industrial water demand in LaSalle County, therefore no water management strategies are recommended for this water user group.

5.3.15.5 Steam-Electric Power

There is no projected steam-electric power water demand in LaSalle County, therefore no water management strategies are recommended for this water user group.

5.3.15.6 Mining

Current water supply for Irrigation is obtained from the Carrizo-Wilcox. Mining is projected to need additional water supplies prior to 2020. Due to a lack of supply in the county, these needs remain unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual Irrigators implement the following water supply plan to meet the projected needs for Irrigation (Table 5.3.15-8).

• Mining Water Conservation to be implemented prior to 2020. Actual needs reduced could vary greatly.

Table 5.3.15-8. Recommended Water Supply Plan for Mining

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	4,088	4,243	3,734	2,290	851	147
Recommended Plan				a second		
Mining Water Conservation	ND	ND	ND	ND	ND	ND
	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1					1

5.3.15.7 Irrigation

Irrigation is projected to have adequate water supplies available from the Carrizo Aquifer, Sparta Aquifer, and run-of-river rights to meet the water user group's projected demand during the planning period.

5.3.15.8 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

This page intentionally left blank.

5.3.16 Medina County Water Supply Plan

Table 5.3.16-1 lists each water user group in Medina County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.16-1. Medina County Management Supply/Shortage b	y Water User
Group	

	Management Supply/Shortage		
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
Benton City WSC			See Atascosa County
Bexar Metropolitan Water District			See Bexar County
City of Castroville	-224	-214	Projected shortage (2020 through 2070)
City of Devine	88	19	No projected shortage
East Medina SUD	257	-70	Projected shortage (2060 through 2070)
City of Hondo	-523	-1,180	Projected shortage (2020 through 2070)
City of La Coste	-10	-56	Projected shortage (2020 through 2070)
City of Lytle			See Atascosa County
City of Natalia	-101	-220	Projected shortage (2020 through 2070)
Yancey WSC	-28	-309	Projected shortage (2020 through 2070)
Rural Area Residential and Commercial*	1,265	1,008	Projected shortage (2020 through 2060)
Industrial/Manufacturing	1,906	1,884	No projected shortage
Steam-Electric Power	0	0	No projected demand
Mining	0	50	No projected shortage
Irrigation*	-31,529	-20,689	Projected shortage (2020 through 2070)
Livestock	0	0	No projected shortage

*These values represent the sum of the Surplus/Shortage values for each river basin and/or across the entire county. These values may differ from the Need value reported in other tables because the Need represents only the sum of the shortages.

5.3.16.1 City of Castroville

Current water supply for the City of Castroville is obtained from the Edwards Aquifer. Castroville is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Castroville implement the following water supply plan to meet the projected needs for the city (Table 5.3.16-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 44 acft/yr by 2020, increasing to 319 acft/yr of supply in 2070.

- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional 224 acft/yr by 2020, decreasing with need to 214 by 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 40 acft/yr by 2020.
- Local Leona Gravels Groundwater to be implemented prior to 2020 can provide an additional 225 acft/yr by 2040, through 2070.

Table 5.3.16-2. Recommended Wat	r Supply Plan for the City of Castroville

5.3.16.2 City of Devine

The City of Devine is projected to have adequate water supplies available from the Edwards Aquifer and the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Devine implement the following water supply plan (Table 5.3.16-4).

• Municipal Water Conservation to be implemented or enhanced in the future. This strategy can provide an additional 4 acft/yr by 2070.

Table 5.3.16-4. Recommended Water Supply Plan for the City of Devine

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Unit Cost (\$/acft)			-			\$770

5.3.16.3 East Medina SUD

Current water supply for East Medina SUD is obtained from the Edwards Aquifer. East Medina SUD is projected to need additional water supplies prior to 2060. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that East Medina SUD implement the following water supply plan to meet the projected needs for the SUD (Table 5.3.16-6).

- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional 11 acft/yr by 2060, increasing to 70 acft/yr of supply in 2070.
- Local Leona Gravels Groundwater to be implemented prior to 2020 can provide an additional 75 acft/yr by 2060, through 2070.

Table 5.3.16-6. Recommended Water Supply Plan for East Medina SUD

5.3.16.4 City of Hondo

Current water supply for the City of Hondo is obtained from the Edwards Aquifer. Hondo is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Hondo implement the following water supply plan to meet the projected needs for the city (Table 5.3.16-8).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 87 acft/yr by 2020, increasing to 747 acft/yr of supply in 2070.
- Edwards Transfers to be implemented prior to 2020. This strategy can provide an additional 523 acft/yr by 2020, increasing to 1,180 acft/yr of supply in 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 103 acft/yr by 2020.

5.3.16.5 City of La Coste

Current water supply for the City of La Coste is obtained from the Edwards Aquifer. La Coste is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that La Coste implement the following water supply plan to meet the projected needs for the city (Table 5.3.16-10).

- Edwards Transfers to be implemented prior to 2020 can provide an additional 10 acft/yr by 2020, increasing to 56 acft/yr of supply in 2070.
- Local Leona Gravels Groundwater to be implemented prior to 2020 can provide an additional 60 acft/yr by 2060, through 2070.

• Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 6 acft/yr by 2020.

Table 5.3.16-10. Recommended Water Supply Plan for the City of La Coste

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.16.6 City of Natalia

Current water supply for the City of Natalia is obtained from the Edwards Aquifer. Natalia is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Natalia implement the following water supply plan to meet the projected needs for the city (Table 5.3.16-12).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 8 acft/yr by 2020, increasing to 54 acft/yr of supply in 2070.
- Edwards Transfers to be implemented prior to 2020 can provide an additional 101 acft/yr by 2020, increasing to 220 acft/yr of supply in 2070.
- Local Leona Gravels Groundwater to be implemented prior to 2020 can provide an additional 225 acft/yr by 2060, through 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 14 acft/yr by 2020.

5.3.16.7 Yancey WSC

Current water supply for Yancey WSC is obtained from the Edwards Aquifer. Yancey WSC is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Yancey WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.16-14).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 11 acft/yr by 2070.
- Edwards Transfers to be implemented prior to 2020 can provide an additional 28 acft/yr by 2020, increasing to 309 acft/yr of supply in 2070.
- Local Leona Gravels Groundwater to be implemented prior to 2020 can provide an additional 310 acft/yr by 2020, through 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 33 acft/yr by 2020.
- Facilities Expansions (System Upgrades)

5.3.16.8 Rural Area Residential and Commercial

Rural Areas have adequate water supplies available from the Edwards Aquifer, Trinity Aquifer, and the Carrizo Aquifer to meet the water user group's projected demand during the planning period. . Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities

and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected needs for rural areas (Table 5.3.16-14).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 27 acft/yr by 2070.

Table 5.3.16-16. Recommended Water Supply Plan for Rural Areas

5.3.16.9 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Edwards Aquifer to meet the water user group's projected demand during the planning period.

5.3.16.10 Steam-Electric Power

There is no projected steam-electric power water demand in Medina County, therefore no water management strategies are recommended for this water user group.

5.3.16.11 Mining

Mining is projected to have adequate water supplies available from the Carrizo Aquifer and the Trinity Aquifer to meet the water user group's projected demand during the planning period.

5.3.16.12 Irrigation

Current water supply for irrigation is obtained from the Edwards Aquifer, Carrizo Aquifer, and run-of-river rights. Irrigation is projected to need additional water supplies prior to 2020. Due to limited economically feasible supplies for irrigation, these needs remain

N

unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual irrigators implement the following water supply plan to meet a portion of the projected needs for irrigation (Table 5.3.16-18).

 Irrigation Water Conservation, while not a recommended strategy, is encourage and can provide additional supply when possible. The SCTRWPG has determined that it is not economically feasible for agricultural producers to pay for additional supplies to meet projected needs.

Table 5.3.16-18. Recommended Water Supply Plan for Irrigation

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.16.13 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

2016 South Central Texas Regional Water Plan Volume I

This page intentionally left blank.

Table 5.3.17-1 lists each water user group in Refugio County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.17-1. Refugio County Management Supply/Shortage by Water User Group

		ement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
City of Refugio	431	654	No projected shortage
City of Woodsboro	243	347	No projected shortage
Rural Area Residential and Commercial	5	163	No projected shortage
Industrial/Manufacturing	0	0	No projected demand
Steam-Electric Power	0	0	No projected demand
Mining	0	0	No projected shortage
Irrigation	0	0	No projected shortage
Livestock	0	0	No projected shortage

5.3.17.1 City of Refugio

The City of Refugio is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Refugio implement the following water supply plan (Table 5.3.17-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 157 acft/yr by 2020, decreasing to 120 acft/yr of supply in 2070.

2016 South Central Texas Regional Water Plan Volume I

5.3.17.2 City of Woodsboro

The City of Woodsboro is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Woodsboro implement the following water supply plan (Table 5.3.17-4).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 68 acft/yr by 2020, decreasing to 26 acft/yr of supply in 2070.

Table 5.3.17-4. Recommended Water Supply Plan for the City of Woodsboro

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr,

5.3.17.3 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Gulf Coast Aquifer to meet their projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the rural areas implement the following water supply plan (Table 5.3.17-6).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 68 acft/yr by 2020, decreasing to 26 acft/yr of supply in 2030.

Table 5.3.17-6. Recommended Water Supply Plan for Rural Areas

5.3.17.4 Industrial/Manufacturing

There is no projected industrial water demand in Refugio County, therefore no water management strategies are recommended for this water user group.

5.3.17.5 Steam-Electric Power

There is no projected steam-electric power water demand in Refugio County, therefore no water management strategies are recommended for this water user group.

5.3.17.6 Mining

Mining is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demand during the planning period.

5.3.17.7 Irrigation

Irrigation is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demand during the planning period.

5.3.17.8 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected demand during the planning period.

5.3.18 Uvalde County Water Supply Plan

Table 5.3.18-1 lists each water user group in Uvalde County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.18-1. Uvalde County Management Supply/Shortage by W	ater User
Group	

	Management Supply/Shortag		Marine Connect Marine
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
City of Sabinal	-121	-277	Projected shortage (2020 through 2070)
City of Uvalde	-943	-2,365	Projected shortage (2020 through 2070)
Rural Area Residential and Commercial	2,938	2,190	No projected shortage
Industrial/Manufacturing	102	117	No projected shortage
Steam-Electric Power	0	0	No projected demand
Mining	0	0	No projected shortage
Irrigation	-29,683	-19,102	Projected shortage (2020 through 2070)
Livestock	0	0	No projected shortage

5.3.18.1 City of Sabinal

Current water supply for the City of Sabinal is obtained from the Edwards Aquifer. Sabinal is projected to need additional water supplies prior to 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Sabinal implement the following water supply plan to meet the projected needs for the city (Table 5.3.18-2).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 20 acft/yr by 2020, increasing to 204 acft/yr of supply in 2070.
- Edwards Transfers to be implemented prior to 2020 can provide an additional 121 acft/yr by 2020, decreasing to 277 acft/yr of supply in 2070.
- Uvalde ASR¹⁴ to be implemented prior to 2020 can provide an additional 121 acft/yr for 2020 increasing to 277 acft/yr by 2070.

 Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 22 acft/yr by 2020.

Table 5.3.18-2. Recommended Water Supply Plan for the City of Sabinal

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.18.2 City of Uvalde

Current water supply for the City of Uvalde is obtained from the Edwards Aquifer. Uvalde is projected to need additional water supplies prior to 2020. Working within the planning

criteria established by the SCTRWPG and the TWDB, it is recommended that Uvalde implement the following water supply plan to meet the projected needs for the city (Table 5.3.18-4).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 178 acft/yr by 2020, increasing to 1,796 acft/yr of supply in 2070.
- Uvalde ASR¹⁵ to be implemented prior to 2020 can provide an additional 943 acft/yr by 2020 increasing to 2,365 acft/yr by 2070.
- Edwards Transfers to be implemented prior to 2020 can provide an additional 943 acft/yr by 2020, increasing to 2,365 acft/yr of supply in 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 203 acft/yr by 2020.

Table 5.3.18-5. Recommended Plan Costs by Decade for the City of Uvalde

5.3.18.3 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Edwards Aquifer and Carrizo Aquifer to meet their projected demands during the planning period.

5.3.18.4 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Edwards Aquifer to meet the water user group's projected demand during the planning period.

5.3.18.5 Steam-Electric Power

There is no projected steam-electric power water demand in Uvalde County, therefore no water management strategies are recommended for this water user group.

5.3.18.6 Mining

Mining is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demand during the planning period.

5.3.18.7 Irrigation

 Current water supply for irrigation is obtained from the Edwards Aquifer and runof-river rights. Irrigation is projected to need additional water supplies prior to 2020. Due to limited economically feasible supplies for irrigation, these needs remain unmet. Working within the planning criteria established by the

SCTRWPG and the TWDB, it is recommended that individual irrigators implement the following water supply plan to meet a portion of the projected needs for irrigation (Irrigation Water Conservation, while not a recommended strategy, is encouraged and can provide additional supply when possible. The SCTRWPG has determined that it is not economically feasible for agricultural producers to pay for additional supplies to meet projected needs.

Table 5.3.18-6).

 Irrigation Water Conservation, while not a recommended strategy, is encouraged and can provide additional supply when possible. The SCTRWPG has determined that it is not economically feasible for agricultural producers to pay for additional supplies to meet projected needs.

Irrigation	-5,265	-5265	Projected shortage (2020 through 2070)
Livestock	0	0	No projected shortage

5.3.19.1 City of Victoria

Current water supply for the City of Victoria is obtained from the Gulf Coast Aquifer and run-of-river rights. The City of Victoria is projected to need additional water supplies starting in the planning year 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Victoria implement the following water supply plan (Table 5.3.19-2).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 809 acft/yr by 2020, increasing to 7,517 acft/yr of supply in 2070.
- Drought Management to be implemented or enhanced in the immediate future. This strategy can provide an additional 856 acft/yr by 2020.
- Victoria County ASR to be implemented by 2030 can provide an additional supply of 7,900 acft by 2030, continuing through 2070.
- Groundwater-Surface Water exchange to be implemented by 2020 can provide an additional 8,544 acft of water by 2020.

Surface Water Rights and Balancing Storage have been identified as recommended water management strategies.

5.3.19.2 Rural Area Residential and Commercial

Rural Areas is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet their projected demands during the planning period.

5.3.19.3 Industrial/Manufacturing

Current water supply for industrial is obtained from the Gulf Coast Aquifer and run-ofriver rights. Industrial is projected to need additional water supplies starting in the planning year 2020. Working within the planning criteria established by the SCTRWPG

and the TWDB, it is recommended that individual industrial operations implement the following water supply plan to meet the projected needs for Industrial (Table 5.3.19-4).

• Purchase from WWP (GBRA) to be implemented in 2020. This strategy can provide an additional 2,178 acft/yr of supply in 2020 increasing to 16,252 acft/yr in 2070.

Table 5.3.19-4. Recommended Water Supply Plan for Industrial

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.19.4 Steam-Electric Power

Steam-electric power obtains water supply from the Gulf Coast Aquifer and run-of-river rights to meet the water user group's needs. The entity is expected to have a shortage prior to 2020. The following water supply plan is recommended for Steam-Electric Power for Victoria County (Table 5.3.19-6).

 Purchase from WWP (GBRA) to be implemented in 2020. This strategy can provide an additional 4,506 acft/yr starting in 2012, increasing to 70,696 acft/yr by 2070.

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.19.5 Mining

Mining is projected to have adequate water supplies available from the Gulf Coast Aquifer to meet the water user group's projected demand during the planning period.

5.3.19.6 Irrigation

Current water supply for irrigation is obtained from the Gulf Coast Aquifer and run-of-river rights. Irrigation is projected to need additional water supplies prior to 2020. Due to limited economically feasible supplies for irrigation, these needs remain unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual irrigators implement the following water supply plan to meet a portion of the projected needs for irrigation (Table 5.3.20-10).

 Irrigation Water Conservation, while not a recommended strategy, is encouraged and can provide additional supply when possible. The SCTRWPG has determined that it is not economically feasible for agricultural producers to pay for additional supplies to meet projected needs.

SS WSC	1,607	-234	Projected shortage (2070 only)
City of Stockdale	1,378	1,020	No projected shortage
Sunko WSC*	488	-117	Projected shortage (2070 only)
Rural Area Residential and Commercial	1,434	49	No projected shortage
Industrial/Manufacturing	0	0	No projected shortage
Steam-Electric Power	0	0	No projected demand
Mining	0	0	No projected shortage
Irrigation	3,085	1,211	No projected shortage
Livestock	0	0	No projected shortage

*These values represent the sum of the Surplus/Shortage values for each river basin and/or across the entire county. These values may differ from the Need value reported in other tables because the Need represents only the sum of the shortages.

5.3.20.1 City of Floresville

Current water supply for the City of Floresville is obtained from the Carrizo Aquifer. Floresville is projected to need additional water supplies prior to 2030. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Floresville implement the following water supply plan to meet the projected needs for the city (Table 5.3.20-2).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 80 acft/yr by 2020, increasing to 1,288 acft/yr of supply in 2070.
- Local Carrizo Groundwater with conversions to be implemented prior to 2030 can provide an additional 1,450 acft/yr by 2030, through 2070.

Table 5.3.20-2. Recommended Water Supply Plan for the City of Floresville

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	8	405	770	1,124	1,445
Recommended Plan						
Municipal Water Conservation	80	272	525	823	1,122	1,288
Local Carrizo Groundwater with Conversions		1,450	1,450	1,450	1,450	1,450
Total New Supply	80	1,722	1,975	2,273	2,572	2,738

Estimated costs of the recommended plan to meet the City of Floresville's projected needs are shown in Table 5.3.20-3.

Table 5.3.20-3. Recommended Plan Costs by Decade for the City of Floresville

Plan Element	2020	2030	2040	2050	2060	2070
Municipal Water Conserva	ation					
Annual Cost (\$/yr)	\$61,446	\$209,311	\$403,998	\$633,905	\$864,101	\$992,139
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770
Local Carrizo Groundwate	er with Convers	ions				
Annual Cost (\$/yr)	-	\$530,000	\$530,000	\$173,000	\$173,000	\$173,000
Unit Cost (\$/acft)		\$366	\$366	\$119	\$119	\$119

Current water supply for the City of La Vernia is obtained from the Carrizo Aquifer. La Vernia is projected to have adequate water supplies through the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that La Vernia implement the following water supply plan (Table 5.3.20-4).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 11 acft/yr by 2020, increasing to 149 acft/yr of supply in 2070.

Table 5.3.20-4. Recommended Water Supply Plan for the City of La Vernia

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.20.3 Oak Hills WSC

Current water supply for Oak Hills WSC is obtained from the Carrizo Aquifer. Oak Hills WSC is projected to have adequate water supplies through the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Oak Hills WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.20-6).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 30 acft/yr by 2020, increasing to 244 acft/yr of supply in 2070.

2016 South Central Texas Regional Water Plan Volume I

Table 5.3.20-6 Recommended Water Supply Plan for Oak Hills WSC

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.20.4 City of Poth

The City of Poth is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Poth implement the following water supply plan (Table 5.3.20-8).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 7 acft/yr by 2020, increasing to 65 acft/yr of supply in 2070.

Table 5.3.20-8. Recommended Water Supply Plan for the City of Poth

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Municipal Water Conservation						
Annual Cost (\$/yr)	\$5,319	\$6,796	\$10,973	\$20,418	\$34,261	\$49,711
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.20.5 SS WSC

Current water supply for SS WSC is obtained from the Carrizo Aquifer. SS WSC is projected to have a shortage prior to 2070. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that SS WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.20-10).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 11 acft/yr by 2060, increasing to 104 acft/yr of supply in 2070.
- Brackish Wilcox Groundwater for SS WSC¹⁶ with conversions to be implemented by 2070 if conversions are applied. This strategy can provide an additional 234 acft/yr by 2070.

Table 5.3.20-10. Recommended Water Supply Plan for SS WSC

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.3.20.6 City of Stockdale

The City of Stockdale is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Stockdale implement the following water supply plan (Table 5.3.20-12).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 13 acft/yr by 2020, increasing to 197 acft/yr of supply in 2070.

Table 5.3.20-12. Recommended Water Supply Plan for the City of Stockdale

5.3-168 | December 2015

5.3.20.7 Sunko WSC

Current water supply for Sunko WSC is obtained from the Carrizo Aquifer. Sunko WSC is projected to need additional water supplies prior to 2070. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Sunko WSC implement the following water supply plan to meet the projected needs for the WSC (Table 5.3.20-14).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 83 acft/yr by 2020, increasing to 154 acft/yr of supply in 2070.
- Local Carrizo Groundwater with Conversions to be implemented prior to 2070. This strategy can provide an additional 120 acft/yr by 2070.

Table 5.3.20-14. Recommended Water Supply Plan for Sunko WSC

Annual Cost (\$/yr)		_	-			\$96,000
Unit Cost (\$/acft)						\$800

5.3.20.8 Rural Area Residential and Commercial

Rural Areas are projected to have adequate water supplies available from the Carrizo Aquifer and run-of-river rights to meet their projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected need for rural areas (Table 5.3.20-16).

 Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 4 acft/yr by 2060, increasing to 73 acft/yr in 2070.

Table 5.3.20-16. Recommended Water Supply Plan for Rural Areas

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	0	0	0	0	0
Recommended Plan						
Municipal Water Conservation	-			1	4	73
Total New Supply					4	73

Estimated costs of the recommended plan for rural areas are shown in Table 5.3.20-17.

5.3.20.9 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demand during the planning period.

5.3.20.10 Steam-Electric Power

There is no projected steam-electric power water demand in Wilson County, therefore no water management strategies are recommended for this water user group.

5.3.20.11 Mining

Mining is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demand during the planning period.

5.3.20.12 Irrigation

Irrigation is projected to have adequate water supplies available from the Carrizo Aquifer, Sparta Aquifer, Queen City Aquifer, and run-of-river rights to meet the water user group's

5.3.20.13 Livestock

Livestock is projected to have adequate water supplies available from local sources to meet the water user group's projected needs during the planning period.

5.3.21 Zavala County Water Supply Plan

Table 5.3.21-1 lists each water user group in Zavala County and its corresponding management supply or shortage in years 2020 and 2070. For each water user group with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

Table 5.3.21-1. Zavala County Management Supply/Shortage by Water User Group

		ement Shortage	
Water User Group	2020 (acft/yr)	2070 (acft/yr)	Comment
City of Crystal City	1,821	1,068	No projected shortage
Zavala County WCID #1	795	575	No projected shortage
Rural Area Residential and Commercial	328	74	No projected shortage
Industrial/Manufacturing	488	240	No projected shortage
Steam-Electric Power	0	0	No projected demand
Mining	0	0	No projected shortage
Irrigation	-18,487	-9,443	Projected shortage (2020 through 2070)
Livestock	0	0	No projected shortage

5.3.21.1 City of Crystal City

The City of Crystal City is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the City of Crystal City implement the following water supply plan (Table 5.3.21-2).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 60 acft/yr by 2020, increasing to 654 acft/yr of supply in 2070.

Table 5.3.21-2. Recommended Water Supply Plan for the City of Crystal City

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	0	0	0	0	0
Recommended Plan						
Municipal Water Conservation	60	197	354	497	573	654
Total New Supply	60	197	354	497	573	654

Estimated costs of the recommended plan for the City of Crystal City are shown in Table 5.3.21-3.

Table 5.3.21-3. Recommended Plan Costs by Decade for the City of Crystal City

Plan Element	2020	2030	2040	2050	2060	2070
Municipal Water Conserv	ation					
Annual Cost (\$/yr)	\$46,295	\$151,309	\$272,943	\$382,840	\$441,413	\$503,324
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.21.2 Zavala County WCID #1

Zavala County WCID #1 is projected to have adequate water supplies available from the Carrizo Aquifer to meet the city's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that the WCID implement the following water supply plan (Table 5.3.21-4).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 24 acft/yr by 2020, increasing to 282 acft/yr of supply in 2070.

Table 5.3.21-4. Recommended Water Supply Plan for Zavala County WCID #1

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	0	0	0	0	0
Recommended Plan						
Municipal Water Conservation	24	66	113	168	224	282
Total New Supply	24	66	113	168	224	282

Estimated costs of the recommended plan for Zavala County WCID #1are shown in Table 5.3.21-5.

Plan Element	2020	2030	2040	2050	2060	2070
Municipal Water Conserv	ation					
Annual Cost (\$/yr)	\$18,179	\$50,942	\$86,666	\$128,979	\$172,400	\$217,088
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

Table 5.3.21-5. Recommended Plan Costs by Decade for Zavala County WCID #1

5.3.21.3 Rural Area Residential and Commercial

Rural areas are projected to have adequate water supplies available from the Carrizo Aquifer to meet their projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that rural area water supply districts and authorities and individual households and/or businesses not served by public water supply systems implement the following water supply plan to meet the projected needs for rural areas (Table 5.3.21-6).

• Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy can provide an additional 10 acft/yr by 2020, increasing to 98 acft/yr in 2070.

Table 5.3.21-6. Recommended Water Supply Plan for Rural Areas

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)
Projected Need (Shortage)	0	0	0	0	0	0
Recommended Plan						
Municipal Water Conservation	10	23	37	55	75	98
Total New Supply	10	23	37	55	75	98

Estimated costs of the recommended plan for rural areas are shown in Table 5.3.21-7.

Table 5.3.21-7. Recommended Plan Costs by Decade for Rural Areas

Plan Element	2020	2030	2040	2050	2060	2070
Municipal Water Conservation						
Annual Cost (\$/yr)	\$7,726	\$17,669	\$28,144	\$42,334	\$57,995	\$75,404
Unit Cost (\$/acft)	\$770	\$770	\$770	\$770	\$770	\$770

5.3.21.4 Industrial/Manufacturing

Industrial is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demand during the planning period.

5.3.21.5 Steam-Electric Power

There is no projected steam-electric water demand in Zavala County, therefore no water management strategies are recommended for this water user group.

5.3.21.6 Mining

Mining is projected to have adequate water supplies available from the Carrizo Aquifer to meet the water user group's projected demand during the planning period.

5.3.21.7 Irrigation

Current water supply for irrigation is obtained from the Carrizo Aquifer. Irrigation is projected to need additional water supplies prior to 2020. Due to limited economically feasible supplies for irrigation, these needs remain unmet. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that individual irrigators implement the following water supply plan to meet a portion of the projected needs for irrigation (Table 5.3.21-8).

• Irrigation Water Conservation, while not a recommended strategy, is encouraged and can provide additional supply when possible. The SCTRWPG has determined that it is not economically feasible for agricultural producers to pay for additional supplies to meet projected needs.

Table 5.3.21-8. Recommended Water Supply Plan for Irrigation

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Water Supply Plans for Wholesale Water Providers

Table 5.4-1 lists each Wholesale Water Provider identified by the SCTRWPG and their corresponding management supply or shortage in years 2020 and 2070. For each Wholesale Water Provider with a projected shortage, or need, a water supply plan has been developed and is presented in the following subsections.

		ement Shortage	
Major Water Provider	2020 (acft/yr)	2070 (acft/yr)	Comment
San Antonio Water System (SAWS)	-110,677	-244,956	Projected Shortages (2020 through 2070)
Guadalupe-Blanco River Authority (GBRA)	-9,593	-170,949	Projected Shortages (2020 through 2070)
Canyon Regional Water Authority (CRWA)	-8,204	-21,343	Projected Shortages (2020 through 2070)
Cibolo Valley Local Government Corporation (CVLGC)	0	-10,000	Projected Shortages (2030 through 2070)
Hays/Caldwell Public Utility Agency (HCPUA)	-3,182	-21,833	Projected Shortages (2020 through 2070)
Schertz-Seguin Local Government Corporation (SSLGC)	-5,776	-7,111	Projected Shortages (2020 through 2070)
Springs Hill WSC (SHWSC)	4,267	1,661	Projected Surplus
Texas Water Alliance (TWA)	0	-22,575	Projected Shortages (2040 through 2070)

Table 5.4-1. Wholesale Water Providers

Recommended and alternative water management strategies to meet the projected needs of each city, utility, water user group, and wholesale water provider in the South Central Texas Region are summarized in tables generated by the TWDB Regional Water Planning Database (DB17) in Appendix A.

This page intentionally left blank.

5.4.1 San Antonio Water System (SAWS)

Current water supply for SAWS is obtained from the Edwards Aquifer, Trinity Aquifer, Carrizo-Wilcox Aquifer, Canyon Reservoir, Aquifer Storage and Recovery (ASR), and Direct Reuse. SAWS is projected to need additional water supplies prior to the year 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that SAWS implement the following water supply plan to meet the projected needs for SAWS (Table 5.4-2).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy has been assigned to each individual Water User Group (WUG) based on the Municipal Water Conservation water management strategy recommended by the SCTRWPG.
- Brackish Wilcox Groundwater for SAWS to be implemented starting by 2020. This strategy can provide an additional 5,622 acft/yr of supply by 2020.
- Expanded Local Carrizo to be implemented by 2020. This strategy can provide an additional 5,500 acft/yr of supply for the year 2020 decreasing to 5,419 acft/yr by 2060.
- Vista Ridge Consortium to be implemented prior to 2020. This strategy can provide an additional 19,442 acft in 2020 increasing to 34,894 acft/yr by 2070.
- Expanded Brackish Wilcox Project to be implemented prior to 2030 has no yield under the existing MAG.
- Direct Recycled Water Programs to be implemented prior to 2020. This strategy can provide an additional 5,000 acft/yr of supply by the year 2020 increasing to 40,000 by 2070.
- Drought Management to be implemented prior to 2020. This strategy can provide an additional 14,764 acft/yr of supply for the year 2020 increasing to 68,190 acft/yr by 2070.
- Advanced Meter Infrastructure
- Facilities Expansions/Integration Pipelines1
- Seawater Desalination to be implemented prior to 2050. This strategy can provide an additional 84,023 acft/yr of supply by 2050.
- CPS Direct Recycle Pipeline to be implemented prior to 2020 can provide 50,000 acft/yr of non-potable supply.

The following are alternative water management strategies: Brackish Groundwater for Saws (Envisioned), Expanded Local Carrizo (Envisioned), Vista Ridge Consortium (Envisioned), Expanded Brackish Project (Envisioned).

¹ Systems and pipelines have no associated firm yield, but are necessary to deliver new sources of supply to SAWS customers.

5.4.2 Guadalupe-Blanco River Authority (GBRA)

Current water supply for GBRA is obtained from Canyon Reservoir and run-of-river rights. GBRA is projected to need additional water supplies by 2020 to meet the Wholesale Water Provider's projected demands. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that GBRA implement the following water supply plan to meet the projected needs for GBRA (Table 5.4-4).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy has been assigned to each individual Water User Group (WUG) based on the Municipal Conservation water management strategy recommended by the SCTRWPG.
- GBRA Mid-Basin Water Supply Project (Surface Water with ASR) to be implemented prior to 2020. This strategy can provide an additional 50,000 acft/yr for 2020 through 2070.
- Western Canyon WTP Expansion to be implemented by 2060. The project doesn't increase GBRA's supplies, but allows them to deliver additional existing supplies from Canyon Reservoir to customers in Comal and Kendall Counties.
- Integrated Water-Power Project (Upper & Mid Basin) to be implemented prior to 2060. This strategy can provide an additional 100,000 acft/yr for 2020 through 2070.
- GBRA Lower Basin Storage (500 acre Site)² to be implemented prior to 2020. This strategy can provide an additional 51,800 acft/yr for 2020 through 2070.
- GBRA New Appropriation (Lower Basin) to be implemented prior to 2050. This strategy can provide an additional 42,000 acft/yr for 2050 through 2070.
- Victoria County Steam-Electric to be implemented prior to 2050. This strategy can provide an additional 29,100 acft/yr for 2050 through 2070.

The following are alternative water management strategies: Luling ASR, MBWSP-Carrizo Groundwater (Option 0), MBWSP-Surface Water w/ Off-Channel Reservoir (Option 2A), MBWSP Conjunctive Use w/ASR (Option 3A), HPCUA/TWA/GBRA Shared Facilities Project, and Storage above Canyon Reservoir (ASR).

² Firm yield estimate based on off-channel storage of 2,500 acft.

2016 South Central Texas Regional Water Plan Volume I

This page intentionally left blank.

Current water supply for CRWA is obtained from GBRA, various existing surface water rights and leases, and the Carrizo Aquifer. CRWA is projected to need additional water supplies prior to the year 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that CRWA implement the following water supply plan to meet the projected needs for CRWA (Table 5.4-6).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy has been assigned to each individual member Water User Group (WUG) based on the Municipal Conservation water management strategy recommended by the SCTRWPG, and quantities are not tabulated in the CRWA tables referenced here.
- CRWA Wells Ranch Project Phase II³ to be implemented prior to 2020. This strategy can provide an additional 7,829 acft/yr of supply for the years 2020 through 2070.
- Hays/Caldwell PUA Project⁴ to be implemented prior to 2020. This strategy can provide an additional 3,182 acft/yr of supply in the year 2020, increasing to 6,744 acft/yr of additional supply by 2070.
- Brackish Wilcox Groundwater for CRWA⁵ to be implemented prior to 2030. This strategy can provide an additional 1,112 acft/yr of supply by year 2030, increasing to 3,839 acft/yr by 2070.
- CRWA Siesta Project to be implemented prior to 2030. This strategy can provide an additional 5,042 acft/yr for 2030 through 2070.

	2020 (acft/yr)	2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

5.4.4 Cibolo Valley Local Government Corporation (CVLGC)

CVLGC is projected to need additional water supplies prior to the year 2030. There is no current supply for CVLGC. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that CVLGC implement the following water supply plan to meet the projected needs for CVLGC (Table 5.4-12).

• CVLGC Carrizo Project⁶ in Wilson County with Transfers to be implemented prior to 2020. This strategy can provide an additional 10,000 acft/yr of supply in the year 2020 through 2070.

5.4.5 Hays-Caldwell Public Utility Agency (HCPUA)

HCPUA is projected to need additional water supplies prior to the year 2020. There is no current Supply for HCPUA. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that HCPUA implement the following water supply plan to meet the projected needs for HCPUA (Table 5.4-12).

• Hays/Caldwell PUA Project⁷ to be implemented prior to 2020. This strategy can provide an additional 10,300 acft/yr of supply in the year 2020, increasing to 21,833 acft/yr of additional supply through 2060.

Alternative water management strategies for HCPA are the HCPUA/TWA Shared Facilities Project⁸ and the HCPUA/TWA/GBRA Shared Facilities Project⁹.

5.4.6 Schertz-Seguin Local Government Corporation (SSLGC)

Current water supply for SSLGC is obtained from the Carrizo Aquifer. SSLGC is projected to need additional water supplies prior to the year 2020. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that SSLGC implement the following water supply plan to meet the projected needs for SSLGC (Table 5.4-12).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy has been assigned to each individual Water User Group (WUG) based on the Municipal Conservation water management strategy recommended by the SCTRWPG.
- Regional Carrizo for SSLGC Project Expansion to be implemented prior to 2020. This strategy can provide an additional 6,500 acft/yr of supply in the year 2020 through 2070.
- Brackish Wilcox (Gonzales County)¹⁰ to be implemented prior to 2020. This strategy can provide an additional 52 acft/yr of supply in the year 2020, decreasing to 0 acft/yr in 2030 before increasing to 1,278 acft/yr by 2070.

	2020 (acft/yr)	· 2030 (acft/yr)	2040 (acft/yr)	2050 (acft/yr)	2060 (acft/yr)	2070 (acft/yr)

Springs Hill WSC (SHWSC) 5.4.7

Springs Hill WSC is projected to have adequate water supplies available from the Carrizo Aquifer and Canyon Reservoir to meet the WSC's projected demands during the planning period. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that Springs Hill WSC implement the following water supply plan (Table 5.4-14).

Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy has been assigned to each individual Water User Group (WUG) based on the Municipal Conservation water management strategy recommended by the SCTRWPG.

5.4.8 Texas Water Alliance (TWA)

Texas Water Alliance is projected to have shortages during the planning period. There is no current supply for TWA. Working within the planning criteria established by the SCTRWPG and the TWDB, it is recommended that TWA implement the following water supply plan (Table 5.4-16).

- Municipal Water Conservation to be implemented or enhanced in the immediate future. This strategy has been assigned to each individual Water User Group (WUG) based on the Municipal Conservation water management strategy recommended by the SCTRWPG.
- TWA Regional Carrizo¹¹ is to be implemented by 2020. This strategy can provide an additional supply of 5,000 acft/yr in 2020 increasing to 15,000 by 2070.
- TWA Trinity is to be implemented by 2030. This strategy can provide an additional supply of 500 acft/yr, starting in 2030, increasing to 5,000 by 2060.

Chapter 5.5

5.5 Water Conservation

[31 TAC §357.34]

The South Central Texas Regional Water Planning Group (SCTRWPG) strongly supports water conservation, and for the 2016 Regional Water Plan has recommended municipal water conservation water management strategies. Water conservation in the industrial and steam-electric power generation use categories are encouraged as well. Each of the water conservation water management strategies is described briefly below.

Municipal Water Conservation: The South Central Texas Regional Water Planning Group established municipal water conservation goals, as follows:

- For municipal water user groups (WUGs) with water use of 140 gpcd and greater, reduction of per capita water use by 1 percent per year until the level of 140 gpcd is reached, after which, the rate of reduction of per capita water use is one-fourth percent (0.25 percent) per year for the remainder of the planning period; and
- For municipal WUGs having year 2000 water use of less than 140 gpcd, reduction of per capita water use by one-fourth percent per year.

The municipal water conservation water management strategy included in the 2006, 2011, and 2016 Regional Water Plans is based upon water conservation Best Management Practices (BMPs) for municipal water users, as included in the Water Conservation Implementation Task Force November 2004 Report to the 79th Texas Legislature. The list of Municipal Water Conservation BMPs is as follows:

- 1. System Water Audit and Water Loss;
- 2. Water Conservation Pricing;
- 3. Prohibition on Wasting Water;
- 4. Showerhead, Aerator, and Toilet Flapper Retrofit;
- 5. Residential Ultra-Low Flow Toilet Replacement Programs;
- 6. Residential Clothes Washer Incentive Program;
- 7. School Education;
- 8. Water Survey for Single-Family and Multi-Family Customers;
- 9. Landscape Irrigation Conservation and Incentives;
- 10. Water-Wise Landscape Design and Conversion Programs;
- 11. Athletic Field Conservation;
- 12. Golf Course Conservation;
- 13. Metering of all New Connections and Retrofitting of Existing Connections;
- 14. Wholesale Agency Assistance Programs;
- 15. Conservation Coordinator;
- 16. Reuse of Reclaimed Water;
- 17. Public Information;
- 18. Rainwater Harvesting and Condensate Reuse;
- 19. New Construction Graywater;
- 20. Park Conservation; and
- 21. Conservation Programs for Industrial, Commercial, and Institutional Accounts.

The SCTRWPG acknowledges and supports the creation and activities of the Water Conservation Advisory Council created by House Bill 4 and Senate Bill 3 of the 80th Texas Legislature. In addition, the SCTRWPG acknowledges and supports the implementation of House Bill 2667 of the 81st Texas Legislature relating to performance standards for plumbing fixtures sold in Texas.

The Municipal Water Conservation water management strategy includes retrofit of plumbing fixtures, adoption and use of efficient clothes washers, and significant reduction of lawn and landscape watering. The combined plumbing fixtures, clothes washers, and lawn watering water conservation practices would reduce municipal water demand by 7,603 acft/yr in 2020, 25,661 acft/yr in 2040, and 96,287 acft/yr in 2070 (Chapter 5.2.1).

In 2020, total cost for implementation and administration of the municipal water conservation water management strategy to meet the Region L goals, as described in the municipal water conservation water management strategy Chapter 5.2.1), is \$5.53 million (\$727/acft/yr), increasing to \$18.18 million (\$708/acft/yr) in 2040, and to \$63.61 in 2070 (\$661/acft/yr).

Irrigation Water Conservation: The irrigation water conservation water management strategy is based upon water conservation Best Management Practices for agricultural water, as included in the Water Conservation Implementation Task Force November 2004 Report to the 79th Texas Legislature. The list of Irrigation BMPs is as follows:

- 1. Irrigation Scheduling;
- 2. Volumetric Measurement of Irrigation Water Use;
- 3. Crop Residue Management and Conservation Tillage;
- 4. On-farm Irrigation audit;
- 5. Furrow Dikes;
- 6. Land Leveling;
- 7. Contour Farming;
- 8. Conservation of Supplemental Irrigated Farmland to Dry-Land Farmland;
- 9. Brush Control/Management;

10. Lining of On-Farm Irrigation Ditches;

11. Replacement of On-/farm Irrigation Ditches with Pipelines;

12. Low Pressure Center Pivot Sprinkler Irrigation Systems;

13. Drip/Micro-Irrigation System;

- 14. Gated and Flexible Pipe for Field Water Distribution Systems;
- 15. Surge Flow Irrigation for Field Water Distribution Systems;
- 16. Linear Move Sprinkler Irrigation Systems;
- 17. Lining of District Irrigation Canals;
- 18. Replacement of District Irrigation Canals and Lateral Canals with Pipelines;
- 19. Tailwater Recovery and Use System; and
- 20. Nursery Production Systems.

Best Management Practices of Low Energy Precision Application (LEPA) techniques can reduce water needed per acre by 20 percent of the rates estimated to have been used in Region L in year 2000.

Industrial, Steam-Electric Power, and Mining Water Conservation: Best Management Practices for industrial, steam-electric power, and mining water conservation, as included in the Water Conservation Implementation Task Force November 2004 Report to the 79th Texas Legislature are as follows:

- 1. Industrial Water Audit;
- 2. Industrial Water Waste Reduction;
- 3. Industrial Submetering;
- 4. Cooling Towers;
- 5. Cooling Systems Other than Cooling Towers;
- 6. Industrial Alternative Sources and Reuse of Process Water;
- 7. Rinsing/Cleaning;
- 8. Water Treatment;
- 9. Boiler and Steam Systems;
- 10. Refrigeration (including Chilled Water);
- 11. Once-through Cooling;
- 12. Management and Employee Programs;
- 13. Industrial Landscape; and
- 14. Industrial Site Specific Conservation.

BMPs of air cooling, reuse of treated wastewater, and onsite collection and use of precipitation runoff for mining are recommended. Potential quantities and costs, however, could not be estimated due to lack of data.

Model Municipal Water Conservation Plan: The model municipal water conservation plan required for the South Central Texas Regional Water Plan has the following components:

- A. Utility Profile
 - I. Population and Customer Data
 - II. Water Use Data for Service Area
 - III. Water Supply System Data
 - IV. Wastewater System Data
- B. Requirements for Water Conservation Plans for Municipal Water Use by Public Water Suppliers
 - 1. Specific, Quantified 5 and 10 year water conservation targets and goals for municipal water use, in gallons per capita per day
 - 2. Metering Devices Description Required
 - 3. Universal Metering Program Required
 - 4. Unaccounted-For Water Use Measures to Determine and Control
 - 5. Continuing Public Education & Information Program Description Required
 - 6. Non-Promotional Water Rate Structure Required, and included in Water Conservation Plan
 - 7. Reservoir Systems Operation Plan Required, if Applicable
 - 8. Enforcement Procedure & Plan Adoption Means of Implementation and Enforcement Requirements
 - Coordination with the Regional Water Planning Group(s) Documentation of consistency with Regional Water Plans
 - 10. Additional Requirements
 - a. Program for Leak Detection, Repair, and Water Loss Accounting
 - b. Record Management System, and
 - c. Plan Review and Update every 5 years.

Water conservation information and guidance in the development of municipal water conservation plans can be found at the following web site:

www.tceq.state.tx.us/permitting/water_supply/water_rights/conserve.html

Model Irrigation Water Conservation Plan: There is no model irrigation water conservation plan in the South Central Texas Regional Water Plan. A form is provided by TCEQ to assist in conservation plan development for individually operated irrigation systems at the following web site:

www.tceq.state.tx.us/assets/public/permitting/watersupply/water_rights/10238.pdf

Model Industrial/Mining Water Conservation Plan: There is no model industrial/mining water conservation plan in the South Central Texas Regional Water Plan. A form is provided by TCEQ to assist in conservation plan development for industrial/mining water use at the following web site:

www.tceq.state.tx.us/assets/public/permitting/forms/10213.pdf

Recommendation: The South Central Texas Regional Water Planning Group strongly recommends the implementation of the Municipal, Industrial, Irrigation, Steam-Electric Power Generation, and Mining Water Conservation, and that each water user develop, implement, and maintain a Water Conservation Plan that meets or exceeds the requirements of applicable law.

 Chapter 6

Impacts of the Regional Water Plan and Consistency with Protection of Water Resources, Agricultural Resources, and Natural Resources

[31 TAC §357.40 & 31 TAC §357.41]

6

The 2016 South Central Texas Regional Water Plan (2016 Plan) is consistent with long-term protection of the state's water resources, agricultural resources, and natural resources and is based on principles outlined in the Texas Administrative Code Chapter 357. The 2016 Plan was formulated and developed with an understanding of the importance of orderly development, management, and conservation of water resources to meet the Region's near and long-term water needs during drought. The plan recognizes and honors all laws and existing permits applicable to water use for the state and regional water planning areas and, in the case of groundwater, recognizes and takes into account the programs and rules of groundwater conservation districts within the South Central Texas Water Planning Region (Chapter 3) as well as the Texas Water Development Board rules and guidance for regional water planning.

The 2016 Plan identifies actions and policies necessary to meet the Region's projected municipal, industrial, steam-electric power, mining, livestock, and some irrigation needs, by developing and recommending water management strategies (WMS) to meet these needs at a reasonable cost (Chapter 5). It was not possible, however, to develop economically feasible strategies to meet most of the projected needs of irrigated agriculture. A socioeconomic impact analysis was performed to estimate the economic loss associated with not meeting these needs (Appendix F).

Development of the 2016 Plan included consideration of some environmental information resulting from site-specific studies and ongoing water development projects when evaluating water management strategies. A list of endangered and threatened species and species of concern for each county of the region was obtained from the Texas Parks & Wildlife Department (TPWD) and the possible habitats for these species were considered for each water management strategy (Chapter 5.2 and Appendix G). In addition, an environmental assessment, potential environmental effects analysis, and cumulative effects analyses were performed for the recommended water management strategies of the plan (Chapters 6.1 and 6.2). Chapter 6.7 summarizes the environmental benefits and concerns associated with implementation of the 2016 South Central Texas Regional Water Plan.

The 2016 Plan includes water conservation and drought management water management strategies based upon municipal water conservation best management practices (BMPs), and initiatives to respond to drought conditions by the municipal water user groups, and the use of water conservation BMPs in the irrigation water use group.

The 2016 SCTRWP is based, in part, on voluntary transfers of water resources to meet projected needs, including the underlying principles that local area projected needs to 2070 are met before any consideration is given to movement of water from rural and agricultural areas

to meet projected needs at more distant locations, that compensation will be made to water owners for water to meet projected needs of others, and an evaluation made of the social and economic impacts of voluntary transfers of water from rural and agricultural areas.

The South Central Texas Regional Water Planning Group (SCTRWPG) conducted quarterly public meetings during the 2016 planning cycle and based its decisions upon the best available information. The SCTRWPG coordinated water planning and management activities with local, regional, state, and federal agencies and cooperated and coordinated with Regions N, P, K, G, and J (Coastal Bend, Lavaca, Lower Colorado, Brazos G, and Plateau, respectively) to identify common needs and cooperative opportunities.

The SCTRWPG has conditionally recommended that five stream segments be designated as having unique ecological value by the Texas Legislature. The SCTRWPG developed policy recommendations for the 2016 Plan including agricultural water, transport of water, groundwater, surface water, conservation, innovative strategies, the environment, providing and financing water and wastewater systems, data, and other issues (Chapter 8).

6.1 Cumulative Effects of Regional Water Plan Implementation

The cumulative effects are quantified through long-term simulation of natural hydrologic processes including precipitation, streamflow, aquifer recharge, springflow, and evaporation as they are affected by human influences such as aquifer pumpage, reservoirs, diversions, and the discharge of treated effluent. Figure 6-1 illustrates the connectivity of the various groundwater and surface water models, as well as the water management strategies of the 2016 Plan.

6.1.1 Groundwater and Springs

Cumulative effects of plan implementation for the Edwards Aquifer are presented based on full implementation of the Edwards Aquifer Habitat Conservation Plan (EAHCP). The EAHCP was approved in 2013 by the US Fish and Wildlife Service. On March 14, 2013, the SCTRWPG agreed that the EAHCP be considered a recommended water management strategy (WMS) in implementation for the 2016 Regional Water Plan. Furthermore, the SCTRWPG agreed that springflows associated with EAHCP implementation be used in evaluating existing supplies and potentially feasible surface water management strategies for the 2016 Plan.

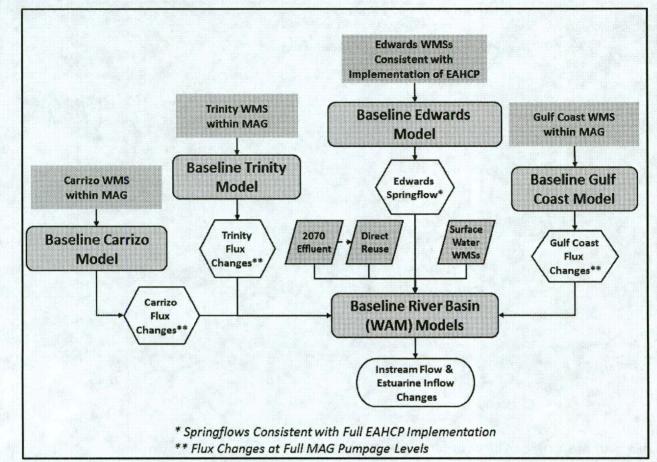

Figure 6-1 Flowchart for Assessment of Cumulative Effects of Regional Water Plan Implementation on Water Resources

The EAHCP includes four flow protection measures: Voluntary Irrigation Suspension Program Option (VISPO), Conservation Program, Use of SAWS ASR with Tiered Leases and Pumping Off-Set, and Stage V Reductions. As of the issuance of this plan, each of these measures has been implemented to some degree. Graphics illustrating the effects of each measure on springflow at Comal Springs (Figure 6-2) and San Marcos Springs (Figure 6-3) during a repeat of the drought of record are presented herein.

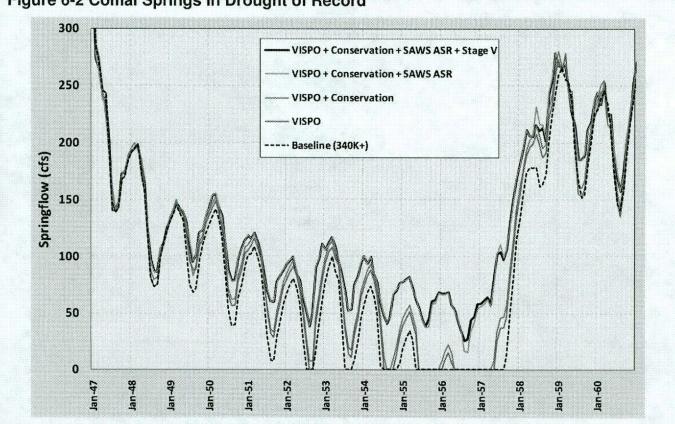

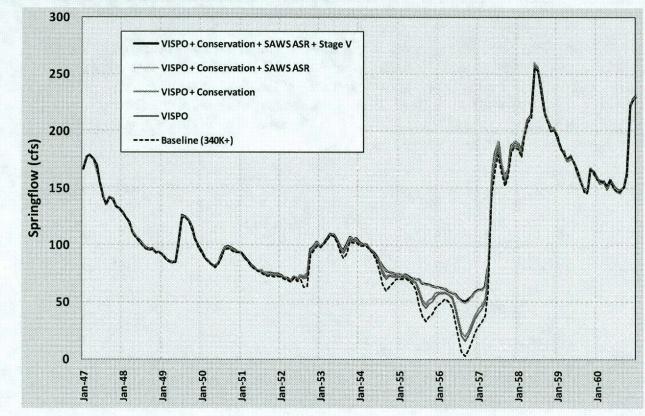

Figure 6-2 Comal Springs in Drought of Record

Effects of Pumpage on Aquifers

The long-term cumulative effects of recommended water management strategies in the 2016 Plan on the Trinity, Carrizo-Wilcox, and Gulf Coast Aquifers presented herein are consistent with model simulations performed by the TWDB in determining the Modeled Available Groundwater (MAG) consistent with the Desired Future Condition (DFC) of the aquifers. In considering the effects of full MAG utilization for these three aquifers, the SCTRWPG recognizes that actual withdrawals may increase more slowly through time as local and export uses grow to full permitted or MAG levels.

The 2016 SCTRWP includes three recommended water management strategies with source water from the Trinity Aquifer: Local Groundwater, NBU Trinity, and TWA Trinity. These WMSs total about 15,000 acft/yr of new supply. Figure 6-4 illustrates hydrographs for representative Trinity Aquifer wells in Kendall and Bexar Counties for pumping consistent with full utilization of the MAG. Figure 6-5 illustrates maximum expected drawdowns in the Trinity Aquifer associated with pumpage of the MAG from 2010 to 2060.

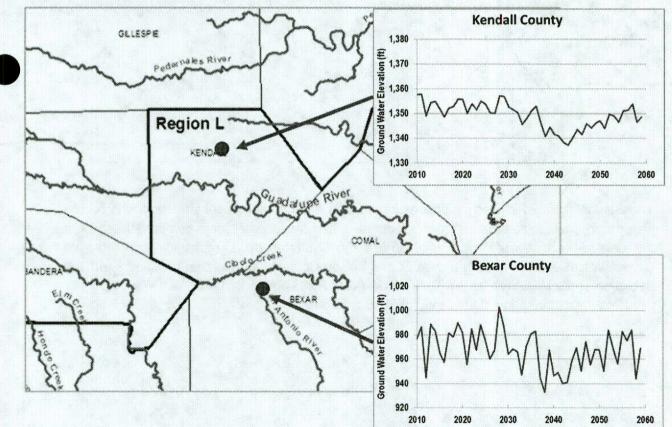

Figure 6-4 Trinity Aquifer Well Hydrographs

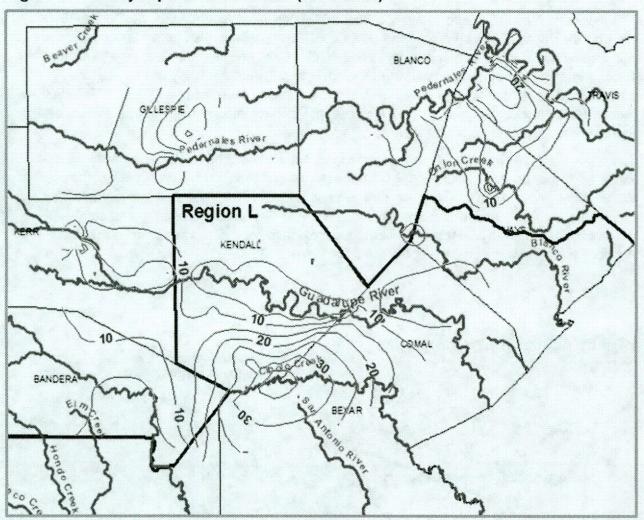

Figure 6-5 Trinity Aquifer Drawdowns (2010-2060)

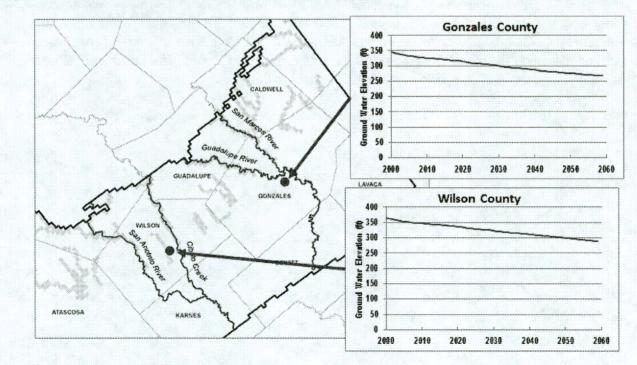

The 2016 SCTRWP includes multiple recommended water management strategies with source water from the Carrizo-Wilcox Aquifer. Table 6-1 lists these water management strategies in the Carrizo-Wilcox Aquifer by county. Figure 6-6 illustrates hydrographs for representative Carrizo-Wilcox Aquifer wells in Gonzales and Wilson Counties for pumping consistent with full utilization of the MAG. Figure 6-7 illustrates expected drawdowns in the Carrizo-Wilcox Aquifer associated with pumpage of the MAG for 2010 to 2060.

Table 6-1 Carrizo-Wilcox Water Management Strategies

Figure 6-6 Carrizo-Wilcox Aquifer Well Hydrographs

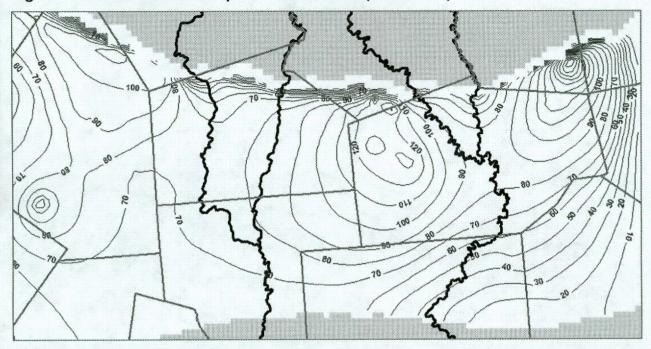

Figure 6-7 Carrizo-Wilcox Aquifer Drawdowns (2000-2060)

The 2016 SCTRWP includes only one recommended water management strategy with source water from the Gulf Coast Aquifer – Local Groundwater. Figure 6-8 illustrates hydrographs for representative Gulf Coast Aquifer wells in Goliad and Victoria Counties for pumping consistent with full utilization of the MAG. Figure 6-9 illustrates expected drawdowns in the Gulf Coast Aquifer associated with pumpage of the MAG for 2010 to 2060.

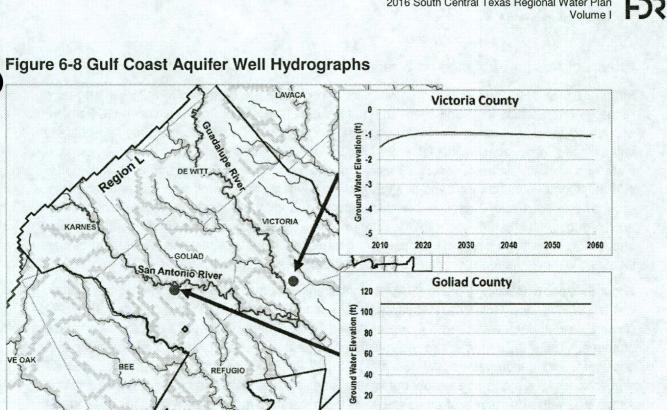

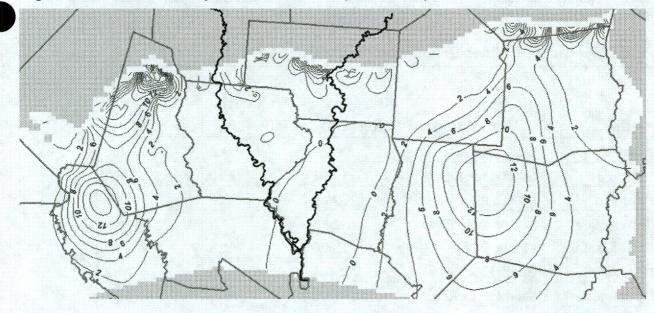

Figure 6-9 Gulf Coast Aquifer Drawdowns (2010-2060)

Effects of Aquifer Pumpage on Streamflow

In the 2016 SCTRWP, increases in groundwater pumpage are expected to outpace long-term recharge rates, which inevitably leads to aquifer-wide drawdowns. In many ways, GCDs have accounted for and planned for this through the setting of DFCs, which translate to the MAG values used in developing the 2016 SCTRWP. With declining groundwater levels, surface water-groundwater interactions (or fluxes) change over time. For example, if an aquifer currently contributes flux (or base flow) to a stream where the aquifer outcrops and long-term groundwater production associated with a recommended WMS results in regional drawdown and reduced flux contribution to the stream, then streamflows will be reduced. These streamflow reductions would be expected to occur gradually over time and manifest at diffuse locations within the stream segment traversing the aquifer outcrop.

Groundwater Availability Models (GAMs) consistent with the MAG pumpage for the Trinity, Carrizo-Wilcox, and Gulf Coast Aquifers were used to extract the effects of long-term MAG pumpage on surface water – groundwater fluxes and estimate maximum expected streamflow changes. Table 6-2 summarizes the maximum potential effects of MAG levels of pumpage, consistent with recommended WMSs in the 2016 SCTRWP, on long-term surface water / groundwater fluxes and streamflow during the planning period. These streamflow reductions associated with MAG levels of pumpage have been included in the GSAWAM for simulation of associated effects on instream flows at selected locations and freshwater inflows to the Guadalupe Estuary. Streamflow reductions shown in Table 6-2 would be mitigated somewhat by the positive effects of recommended ASR projects by GBRA (Carrizo Aquifer, San Marcos River), New Braunfels (Trinity Aquifer, Guadalupe River), and Victoria (Gulf Coast Aquifer, Guadalupe River).

Aquifer	Watershed	Baseline Flux (cfs)	Flux with Plan (cfs)	Streamflow Change (cfs)
Trinity Aquifer	Cibolo Creek	-2.9	-2.2	-0.7
Trinity Aquifer	Guadalupe River	-33.1	-25.0	-8.1
Trinity Aquifer	Blanco River	-28.6	-24.6	-3.9
Carrizo-Wilcox Aquifer	San Antonio River	14.5	24.3	-9.8
Carrizo-Wilcox Aquifer	Cibolo Creek	-2.6	1.8	-4.4
Carrizo-Wilcox Aquifer	Guadalupe River	-0.4	3.8	-4.2
Carrizo-Wilcox Aquifer	San Marcos River	-11.0	8.1	-19.2
Gulf Coast Aquifer	San Antonio River	-10.0	-9.7	-0.4
Gulf Coast Aquifer	Guadalupe River	-7.1	-6.7	-0.4

Table 6-2 SCTRWP Surface Water-Groundwater Flux Changes

Note: Negative values indicate water is flowing FROM the aquifer TO the stream (i.e. a gaining stream). Positive values indicate water is flowing TO the aquifer FROM the stream (i.e. a losing stream).

6.1.2 Surface Water

Potential cumulative effects of implementation of the 2016 SCTRWP on instream flows and freshwater inflows to bays and estuaries have been assessed for seven locations in the Guadalupe-San Antonio River Basin as shown in Figure 6-10. Cumulative effects for stream and estuary locations in the Nueces River Basin have not been assessed, as there are no recommended WMSs in the 2016 SCTRWP expected to significantly affect flows in the Nueces River Basin or freshwater inflows to the Nueces Estuary. The baseline for consideration of effects on flows includes full implementation of the EAHCP, full utilization of existing water rights, and treated effluent discharge representative of current conditions. The cumulative effects of 2016 SCTRWP implementation on flows at selected locations in the Guadalupe – San Antonio River Basin are summarized in Figure 6-11 through Figure 6-17.

Streamflows in the Guadalupe River above Comal River at New Braunfels (Figure 6-11) are not expected to change significantly during the planning period.

For the San Marcos River at Luling (Figure 6-12), streamflows are expected to decrease by a relatively uniform amount primarily due to decreases in the surface water-groundwater fluxes associated with groundwater pumpage consistent with the MAGs in the Trinity and Carrizo-Wilcox Aquifers.

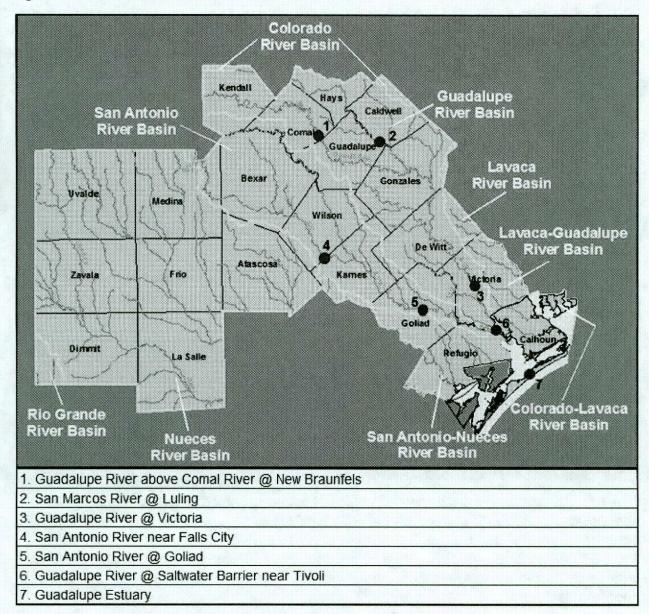

Guadalupe River at Victoria (Figure 6-13) streamflows are expected to decrease between the 15th and 85th percentiles due to recommended Direct Recycle Programs, the GBRA Mid-Basin Water Supply Project, and decreases in surface water-groundwater flux associated with several groundwater strategies in the Trinity and Carrizo-Wilcox Aquifers. Of these decreases, Direct Recycle Programs and MAG pumpage constitute about 50 percent of the changes in streamflows. Streamflows in the lower portion of the flow regime remain largely unchanged with implementation of the 2016 SCTRWP.

Streamflow comparisons indicate that flows in the San Antonio River at Falls City (Figure 6-14) and Goliad (Figure 6-15) will remain generally unchanged for the highest 70 percent of streamflows and will decrease during low flow periods. WMSs affecting flows in the San Antonio River include large direct recycle projects and decreases in the surface water-groundwater flux associated with several groundwater strategies in the Trinity, Carrizo-Wilcox, and Gulf Coast Aquifers.

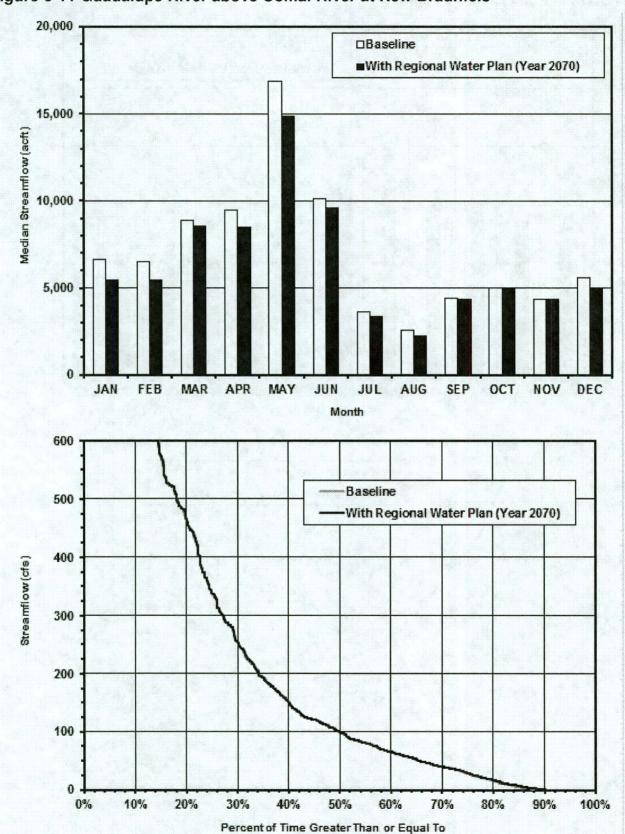

Streamflows/inflows for the Guadalupe River at the GBRA Diversion Dam & Saltwater Barrier near Tivoli (Figure 6-16) and the Guadalupe Estuary (Figure 6-17) would generally decrease with full implementation of all recommended WMSs in the 2016 SCTRWP.

The SCTRWPG has recommended legislative designation of five stream segments in Region L as having unique ecological value. These segments and the bases for recommended designation are described in Appendix H. Implementation of the 2016 SCTRWP is not expected to have any effect on the Nueces, Frio, and Sabinal River segments having unique ecological value as no WMSs are recommended within or upstream of these segments. As shown in Figure 6-2 and Figure 6-3, implementation of the 2016 SCTRWP, including full implementation of the EAHCP (a recommended WMS), is expected to increase long-term average spring discharges which should serve to preserve or enhance the ecological values of the Comal River and San Marcos River segments recommended for designation.

6.2 Environmental Assessment

6.2.1 Regional Environment

The South Central Texas Regional Water Planning Area (Region L) spans southern Texas from Hays and Caldwell Counties in the north to the Guadalupe Estuary on the Gulf Coast, to the headwaters of the Nueces River in Uvalde County. The region exhibits a unique biological diversity as a consequence of its location in an area of transition between major vegetational and faunal regions to the north, east and south (respectively, the Balconian, Texan, and Tamulipan)¹, and its position astride migration corridors important to numerous bird, bat, and insect populations. Locally, the prairie and coastal ecoregions circumscribe sets of habitats, plants, and animals distinct from those of the Central Texas Plateau, and the more tropical affinities of the Southern Texas Plains. The major population centers in Region L are located along the eastern and southern margins of the Edwards Plateau, where a series of rugged, wooded canyons are traversed by clear, spring fed streams intimately associated with the cavernous limestone Edwards Aquifer that provides the present major water supply for the region.

Omernik² utilized criteria that included topography, climate, vegetation type, and land use characteristics to divide the United States into ecological regions, or ecoregions, that exhibit more or less distinct sets of physical habitats and species. According to updated classification based on Omernik's criteria, Region L includes parts of five Ecoregions: the Edwards Plateau, Southern Texas Plains, Texas Blackland Prairies, East Central Texas Plains, and the Western Gulf Coastal Plains.³ Focusing specifically on Texas, and excluding explicit land use criteria, Gould⁴ delineated ten vegetational areas, which generally correspond to the portions of Omernik's Ecoregions that extend into the state. The corresponding names for the vegetational areas found in Region L are the Edwards Plateau, South Texas Plains, Blackland Prairies, Post Oak Savannah, and the Gulf Prairies and Marshes (Figure 6-18).

⁴ Gould, F.W. 1975. <u>The Grasses of Texas</u>. Texas A&M University Press, College Station, Texas.

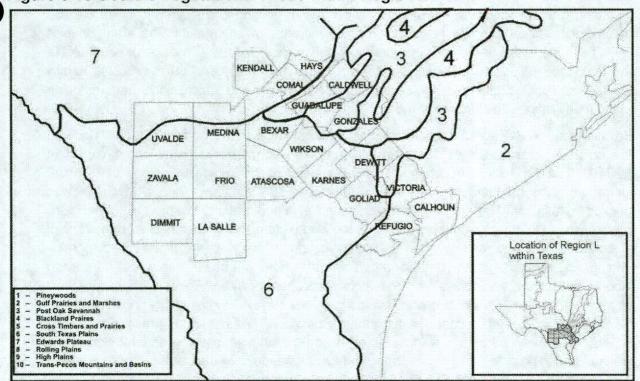

Figure 6-18 Gould's Vegetational Areas within Region L

The Edwards Plateau vegetational area encompasses approximately 24 million acres of tall or mid-grass understory and a brushy, savanna-type overstory complex of live oak (*Quercus virginiana*) and other oaks (*Q. fusiformis, Q. buckleyi, Q sinuata* var. *breviloba*), ashe junipers (*Juniperus ashei*), cedar elm (*Ulmus crassifolia*), mesquite (*Prosopis* sp.), various species of acacia (*Acacia* sp.), and sumacs (*Rhus* ssp., including the prairie flame-leaf (*Rhus copallina* var. *lanceolata*). The most important climax grasses of this area include switchgrass (*Panicum virgatum*), several species of bluestem (*Schizachyrium* and *Andropogon* spp.), gramas (*Bouteloua* spp.), Indiangrass (*Sorghastrum nutans*), Canadian wild rye (*Elymus canadensis*), buffalograss (*Buchloe dactyloides*) and curly mesquite (*Hilaria belanger*).⁵

Juniper and mesquite brush are generally considered invaders into this presumed climax of largely grassland or savannah, except on the steeper slopes which have continually supported a dense cedar-oak thicket. Bald cypress (*Taxodium distichum*) occurs along perennial streams and rivers, while pecan (*Carya illinoinensis*), Arizona and little walnut (*Juglans major, J. microcarpa*), hackberry (*Celtis laevigata*), black and sandbar willow (*Salix nigra, S. interior*), and eastern cottonwood (*Populus deltoides*) are more widely distributed in riparian areas of both perennial and intermittent streams. Cultivated fields are generally in the relatively broad, level stream valleys where deeper soils have accumulated.⁶ Upland agriculture consists primarily of livestock grazing and harvest of cedar and oak for fence posts and firewood, respectively.

The South Texas Plains vegetational area encompasses approximately 20 million acres of level to rolling topography, with elevations ranging from 1,000 ft-msl to about sea level. Soil types cover a wide range, from clays to sandy loams, creating variations in soil drainage and moisture-holding capacities. Though there are large areas of cultivated land, most of the area

⁵ Correll, D.S., and M.C. Johnston, "Manual of Vascular Plants of Texas," Texas Research Foundation, Renner, Texas, 1979. ⁶ Ibid. is still used as rangeland. The South Texas Plains region originally supported a grassland or savannah climax vegetation.⁷ However long periods of grazing and the reduction of fire has affected these plant communities and led to an increase of brush within the area. Species which have increased in the area include honey mesquite (*Prosopis glandulosa*), post oak (*Q. stellata*), live oak, several acacias (*Acacia* spp.) and members of the cactus family (Cactaceae). Distinct differences in climax plant communities and successional patterns occur on the many range sites that are found in this region.

Elevations in the Blackland Prairies vegetational area range from 300 to 800 ft-msl. Uniform, dark-colored calcareous clays, which are interspersed with gray acid sandy loams, constitute the fertile blackland soils. According to Thomas, most of this region is, or has been under cultivation, although there are some excellent native hay meadows and a few unplowed ranches remaining.⁸ The characteristic vegetation of the Blackland Prairies, which includes little bluestem (Schizachyrium scoparium) as the climax dominant grass species of the region, is considered to be a true prairie. Big bluestem (Andropogon gerardi), Indiangrass, switchgrass, sideoats grama (Bouteloua curtipendula), hairy grama (B. hirsuta), tall dropseed (Sporobolus asper), silver bluestem (Bothriochloa saccharoides), and Texas wintergrass (Stipa leucotricha) are other important grasses found in the region.⁹ If heavy grazing is allowed, Texas wintergrass, buffalograss, Texas grama (Bouteloua rigidiseta), smutgrass (Sporobolus indicus), and many annuals may increase or invade the prairies, causing deterioration of the native communities.¹⁰ Other invasive species include mesquite in the southern portion of the Blackland Prairies, and post oak and blackjack oak in areas which include medium to lighttextured soils. Grasses that have been used to seed improved pastures within the Blackland Prairies include dallisgrass (Paspalum dilatatum), common and coastal bermudagrass (Cynodon dactylon), and some native species.

The Post Oak Savannah vegetational area, which covers approximately 8.5 million acres, consists of gently rolling or hilly country, with elevations ranging from 300 to 800 ft-msl. Upland soils of the region include light-colored acid sandy loams or sands. Bottomland soils contain light brown to dark gray acidic soils, with textures which range from sandy loams to clays. This area is characterized by pasturelands which include frequent stands of woodland and occasional areas of cropland. The dominant species of the Post Oak Savannah is post oak, which occurs in open stands with a ground cover of grasses.¹¹ Other associated species include blackjack oak (*Quercus marilandica*), black hickory (*Carya texana*), cedar elm (*Ulmus crassifolia*), and eastern redcedar (*Juniperus virginiana*). This vegetation type is either considered to be a part of the Eastern Deciduous Forest association or as part of the Prairie association.^{12,13,14,15} During the last few decades, many areas of open savannah have been converted into dense woodland stands of post oak and winged elm (*Ulmus alata*). This has occurred as a result of overgrazing, abandonment from cultivation, and removal of fire. Grazing is the major land use of both upland and bottomland sites within this vegetation type. Large

acreages of both upland and bottomland forests have been cleared for grazing and most of these are in tame pasture.

The Gulf Prairies and Marshes vegetational area of Texas consists of about 9,500,000 acres. This nearly level, slowly drained plain is less than 150 ft-msl in elevation and is cut by sluggish rivers, creeks, bayous, and sloughs. Habitats include coastal salt marshes, dunes, prairies, river bottoms, and freshwater ponds. Soils types include acid sands, sandy loams and clavs. The upland prairie soils tend to be heavier textured acid clays or clay loams. Much of the region is fertile farmland or pastureland. The climax vegetation of the region is mostly tall grass prairie or post oak savannah.¹⁶ Principal grasses are big bluestem, little bluestem, seacoast bluestem (S. scoparium var. litoralis), Indiangrass, eastern gamma grass (Tripsacum dactyloides), Texas wintergrass, switchgrass, and gulf cordgrass (Spartina spp.). Seashore saltgrass (Distichlis spicata) occurs on moist saline sites within the area. Since the region is used heavily for ranching and agriculture, this extensive disturbance has allowed invader species, such as mesquite, huisache (Acacia smallii), prickly pear (Opuntia spp.), Acacia (Acacia spp.), ragweed (Ambrosia psilostachya), broomweed (Xanthocephalum spp.) and others to become well established.^{17,18} Heavy grazing and/or abandoned farmland has changed the predominant grasses to species such as broomsedge (Andropogon virginicus). smutgrass, and threeawns (Aristida spp.), and introduced bermudagrass, fescue (Festuca spp.), and dallisgrass.

Within this area, large acreage of both upland and bottomland forests have been cleared for grazing and much of this land is planted with domestic grasses. Major creek and river floodplains may retain more or less well-developed hardwood forests, but upland areas are generally cleared for cultivation or pasturage. However, uplands support scattered, dense, shrubby thickets of oak, huisache, and mesquite and occasional freshwater marshes in relict drainages. Principal tree and shrub species normally observed in upland areas include live oak, post oak, cedar elm, hackberry, honey mesquite, huisache, and yaupon (*llex vomitoria*).^{19,20,21}

In addition to the physiographic and biological diversity of Region L, it is also the location of a unique, region-wide geologic feature called the Edwards Aquifer. The Edwards Aquifer, together with the karst geology of its recharge zone and the remaining major perennial springs, constitute a unique set of habitats in which a significant concentration of isolated, endemic species has developed. The porous to cavernous limestones and dolomites making up the Edwards Aquifer are also the groundwater source that presently supplies water to the City of San Antonio and numerous other users. The Edwards Aquifer is the only underground aquatic habitat in Texas in which vertebrate species live²² and it supports a surprisingly diverse ecosystem. The aquifer has three parts: the drainage, or catchment area, the recharge zone, and the reservoir zone. Input to the aquifer comes from rainfall over the watershed as a whole, but recharge occurs primarily in the beds of streams atop or traversing the recharge zone. The recharge zone consists of a band of fractured and cavernous limestone (Karst geology)

through which surface water enters the aquifer. In addition to the aquatic fauna of the aquifer, the karst limestones in the upland portions of the recharge and contributing zones also harbor a number of endemic, terrestrial cave species.

Where rivers flowing across the plateau have carved deep canyons and exposed the base of the Edwards Limestone, spring fed streams arise and flow south and eastward over the less permeable older formations to the recharge zone, at the base of which a set of large springs (e.g., Leona, San Antonio, Comal, and San Marcos Springs) emerge that support still more species of limited distribution. In addition to their importance as water supplies, the large springs and their associated rivers are also of regional economic importance as scenic and recreational destinations.

Species listed by the Federal or State governments as Endangered or Threatened, species that are candidates for listing as endangered and threatened, and other species of concern are listed and discussed in terms of the potential impacts of each water management strategy in Volume II, and are included by county in Appendix G. Endangered species are not distributed uniformly throughout Region L; they tend to be most densely abundant in the canyons, caves, and springs on the eastern and southern edges of the Edwards Plateau (Hays and Comal Counties, and northern Bexar County) and in the wetland and brackish environments of Calhoun and Refugio Counties.

Listed species tend to fall into one of two broad categories. One category includes widespread, but rare, species whose populations do not appear to be dependent on specific habitat resources that are (at this time) in limited supply (e.g., foraging and nesting areas). These include many of the birds, such as the eagles and hawks that suffered population declines as a result of persistent pesticide toxicity, and Whooping Cranes that were decimated by market hunting. Other listed species tend to be rare because their habitat requirements are met in only a few locations. This second category includes migratory songbirds with specific nesting requirements (i.e., Golden-cheeked Warbler and Black-Capped Vireo), and reaches the extremes of endemism in the spring and cave species found along the edges of the Edwards Plateau in Bexar, Comal, and Hays Counties.

In addition to listed threatened and endangered species, Region L is concerned with aquatic exotic species, including tilapia and sailfin catfish. These species are non-native and invasive and can overtake habitat crucial for other species.

In support of the regional water planning process, the Texas Parks and Wildlife Department (TPWD) screened Texas rivers and streams for reaches or segments that support significant biological resources or functions, or whose continued flows were deemed critical to the maintenance of a downstream resource or public property. Stream reaches identified by TPWD as Ecologically Significant River and Stream Segments in Region L are listed, along with the listing criteria employed in the identification process, in a TPWD report.²³ Segment locations are shown in Figure 6-19. The SCTRWPG has recommended that portions of five of these segments be designated by the Texas Legislature as having unique ecological value (Chapter 8 and Appendix H). Furthermore, the SCTRWPG considers the segments identified by TPWD as a guide for recommending additional segments for future legislative designation (Chapter 8).

²³ Texas Parks & Wildlife Department, "Ecologically Significant River and Stream Segments of Region L (South Central) Regional Water Planning Area," (http://www.tpwd.state.tx.us/publications/pwdpubs/media/pwd_rp_v3400_1163.pdf), July 2005.

With respect to Cultural Resources, Region L is the location of much of the earliest European activity in Texas, including concentrations of important historical sites on Matagorda Bay, along the Guadalupe and San Antonio Rivers, in Bexar County, and at the perennial springs along the margin of the Edwards Plateau. Prehistoric sites also tend to be concentrated in many of the same areas, and Region L contains some of the oldest Native American habitation sites known in the United States. Large National Historic Districts encompass areas on the lower Guadalupe and San Antonio Rivers that are particularly rich in both historic and prehistoric remains.

Table 6-3 Ecologically Significant River and Stream Segments Identified by TPWD in the South Central Texas Regional Water Planning Area

Segment Name	Biological Function	Hydrologic Function	Riparian Conservation	Water Quality Aquatic Life/Uses	Endangered or Threatened Species or Unique Communities
Aransas River	Extensive estuarine wetland habitat	Water quality and flood attenuation performed by estuarine and freshwater wetlands.			Reddish egret (ST), piping plover (FT, ST), white-faced ibis (ST), and wood stork (ST)
Arenosa Creek				Ecoregion stream	
Blanco River		Edwards and Trinity Aquifers Discharge	Blanco State Park	Overall use	Blanco blind salamander (ST)
Carpers Creek				Ecoregion stream	Diverse benthic macroinvertebrate community
Comal River	Significant overall habitat value	Edwards Aquifer Discharge	Landa Park	High water quality and exceptional aquatic life use	Fountain darter (FE/SE), Comal Springs riffle beetle (FE), Comal Springs dryopid beetle (FE), Peck's Cave amphipod (FE/SE), and Comal blind salamander (ST).
Cypress Creek		Trinity Aquifer Discharge, Edwards Aquifer Contributing Zone		Overall use	
Frio River	Texas Natural River Systems Nominee	Edwards Aquifer Recharge and Discharge	Garner State Park	Overall use, aesthetic value	Multiple spring- dependent listed species
Garcitas Creek	Estuarine wetlands display significant overall habitat value			Ecoregion stream	One of few locales where the Texas palmetto occurs naturally.
Geronimo Creek		Sa Mager		Ecoregion stream	
Guadalupe River, Upper		Edwards Aquifer Discharge	Guadalupe River State Park	Overall use, #2 scenic river in Texas	
Guadalupe River, Middle					Contains two of only four known remaining

6.2.2 Environmental Effects

In attempting to evaluate the environmental effects of any activity, it is often useful to consider the effects of construction and operations separately. Construction effects are generally due to disturbances of vegetation and soils, although in specific locations and circumstances, waste disposal, construction in aquatic habitats, noise, or airborne particulates may also be important factors. Operations effects may include (for example) impacts to vegetation, habitats, or endangered species through maintenance practices or changes in streamflows, water quality, or groundwater availability. The potential environmental effects of each water management strategy were evaluated individually and the results are included with the technical evaluation of that strategy in Chapter 5.2 (Volume II). The evaluation in this section focuses on the cumulative impact of all recommended water management strategies in the 2016 SCTRWP, and how that compares with the potential impacts of water management strategies recommended for the South Central Texas Region in past state water plans.

It should be noted that the information available for analysis of potential impacts of water management strategies has changed substantially since similar analyses were performed for previous regional water plans. Earlier analyses were heavily dependent on paper maps and the transfer of information by hand to those maps. Lengths of pipelines and reservoir areas were also determined by measurements on available maps of variable scale. Presently, information used to evaluate potential environmental impacts resulting from water management strategies is primarily produced using Geographic Information Systems (GIS) shapefiles and recent aerial photography. This method of analysis allows for a more site-specific evaluation of the potential issues associated with a specific water management strategy. For example, the TPWD Natural Diversity Database shapefiles include areas which represent documented occurrences of specific species within a project area. In addition, recent aerial photography of the project areas provides an opportunity to evaluate potential habitat impacts based on the actual vegetation type which exists within the project areas rather than a large scale evaluation of general vegetation types.

The environmental assessments of individual water management strategies should be regarded as "worst case" and preliminary in the sense that neither environmental nor engineering site-specific studies have been performed to verify the published data used, finalize facility locations and operational routines, identify locations where risks to environmental resources can be avoided or minimized, and propose compensation for unavoidable impacts. Most of the facilities evaluated herein have been designed and located only in a conceptual sense; the actual locations of intakes, pipeline rights-of-way, reservoirs, and other project features will not be finally determined until site-specific field studies and land acquisition programs have been completed. For that reason, many, if not most, of the potential impacts discussed in the respective water management strategies evaluations, can be avoided or significantly mitigated by relocation of project elements. This is particularly the case with respect to facilities such as pipelines and individual well pads and less so for reservoirs, for which there may be a limited set of suitable sites.

Some of the water management strategies considered in this regional water plan are expected to involve little potential impact to environmental or cultural resources, except secondarily with respect to changes in land use practices that may affect wildlife habitats and uses in both rural and urban areas. These would seem to include the Water Conservation, Drought Management, Facilities Expansions, Local Groundwater, and Recycled Water strategies, as well as strategies that reallocate previously permitted and developed water among different sets of users (e.g., Surface Water Rights which are generally moving water presently authorized for consumptive use from irrigation to municipal uses). Hence, these strategies are not included in the assessment of environmental effects.

Potential adverse environmental and cultural resources impacts are minimized in the 2016 SCTRWP by the recommendation of strategies that maximize the efficient use of existing surface water resources, or which develop groundwater and seawater supplies. These water management strategies avoid the extensive habitat conversions and streamflow changes that can accompany comparable new surface water development. The estimated new firm water supplies provided by the water management strategies recommended in the 2016 SCTRWP and included in the assessment of environmental effects are summarized in Table 6-4 along with strategies included in previous State Water Plans.

Regardless of water source and location, all the recommended water management strategies comprising the Regional Water Plan involve the construction of dispersed facilities that typically have substantial flexibility in terms of alignment or site selection such as water intakes, off-channel storage, pipelines, and well fields. The recommended strategies typically result in only relatively localized disturbances. While a major pipeline may disturb several hundred acres in total, effects are generally minor at the landscape scale because construction and maintenance activities are dispersed among the much larger physiographic and habitat elements in which they are placed. In comparison with storage reservoir projects, the total land area impacted by a well field or river diversion and transmission pipeline is smaller, often by orders of magnitude. Field studies conducted prior to design and easement procurement can substantially reduce the potential to adversely affect unique habitats, endangered species, historic and prehistoric sites, and other resources that are present only at specific locations. For example, where sensitive resources at stream crossings cannot be adequately protected or avoided, horizontal directional drilling can be considered as a construction option to avoid disturbance of aquatic habitats.

Five recommended river diversion strategies, the GBRA Mid-Basin Project (ASR), GBRA New Appropriation (Lower Basin), Lavaca River Off-Channel Reservoir, GBRA Lower Basin Storage, and Victoria County Steam Electric include off-channel reservoir (OCR) or aquifer storage and recovery (ASR) facilities which will be used to ensure firm supplies throughout a drought comparable to the most severe on record. This water supply storage is necessary because the existing water rights and the unappropriated water are either not physically present during low flow periods, or are unavailable due to the demands of senior water rights or environmental flow needs. Protection of senior water rights and compliance with environmental flow standards effectively minimizes effects of these projects on low streamflows. The GBRA Mid-Basin Project includes longer transmission pipelines that traverse several ecologically distinct regions, which inflate the potential effects of the project on vegetation and terrestrial habitats, place project facilities adjacent to more protected species, and increase the potential for adverse effects.

The water management strategies that include development of large amounts of groundwater all avoid the potential environmental and cultural resources impacts usually attendant to development of similar volumes of surface water. However, local residents of the areas that would be affected have expressed concerns about declining well levels and potential impacts to springs and streamflows. Development of a large amount of groundwater from the Carrizo-Wilcox Aquifer will result in some reductions in streamflow in both the San Antonio and Guadalupe Rivers, and in inflows to the Guadalupe Estuary. However, modeling the net effect on streamflows in the San Antonio and Guadalupe Rivers of complete implementation of all the currently recommended water management strategies has not indicated significant changes in streamflows in either river. These groundwater projects do, however, include transmission pipelines from the well fields to the users which may include similar consequent effects as noted for the GBRA Mid-Basin Project in the previous paragraph.

The seawater desalination projects involve little construction disturbance except for the necessary raw water intakes or wells and transmission pipelines. Use of either seawater or brackish bay water sources will entail potential impacts due to impingement and entrainment of aquatic organisms at the intake, and to the need to discharge water 2-3 times as salty as the raw water. Potential impacts from desalination operations can be avoided or significantly minimized by appropriate site selection and design of intake and discharge structures based on the biological and hydrodynamic characteristics of the receiving water. The Seawater Desalination and GBRA IWPP strategies each include a long transmission pipeline for delivery of water from the Texas Gulf Coast to the central part of the state.

In order to assess the potential cumulative environmental impacts of all the recommended water management strategies having quantifiable impacts, a method was developed to numerically characterize the environmental effects of each water management strategy in terms such that very different kinds of impacts could be aggregated and the results compared. To evaluate the resulting impact scores of the 2016 SCTRWP (which will become a part of the 2017 State Water Plan) relative to the possible universe of water management strategies available to the region, we compare the present set of recommended water management strategies to those proposed for the South Central Texas Region in previous State Water Plans.

The location and extent of potential disturbances to environmental and cultural resources are based on the descriptions and environmental assessments of the water management strategies in Chapter 5.2 (Volume II) and updated information developed by HDR Engineering, Inc. during the current regional water planning effort. Pipeline routes were produced digitally by HDR and pipeline lengths and areas were calculated using ArcMap geographic information system software. A 30-foot permanent easement corridor was assigned to pipelines with pipe diameters less than 36 inches and a 40-foot corridor for those with diameters greater than 36 inches. A 100-foot temporary construction corridor was assumed for all pipelines. Areas inundated by reservoirs recommended in the 2016 SCTRWP were obtained from GIS analyses. The areas for smaller ancillary facilities such as water treatment plants, pump stations, storage units, and wells were estimated and added to the total impact area of each project.

Recommended water management strategies that involve only reallocation of previously appropriated water using existing infrastructure are not included in this analysis. These strategies, which include conservation, some reuse, transfer of water among user groups, and local groundwater development, do not generally require additional reservoirs, pipelines, or other structures that would have significant environmental impacts. For consistency with water planning evaluation protocols used in this report, diversion and use of currently appropriated water is not considered to result in certain aquatic habitat impacts.

This assessment was completed using a matrix approach to perform a series of parallel evaluations of each water management strategy for its potential to impact:

- 1. Endangered and Threatened Species;
- 2. Vegetation and Wildlife Habitats;
- 3. Water Quality and Aquatic Habitats; and/or
- 4. Cultural Resources.

The impact values were tabulated, summed for all water management strategies in each of the State Water Plans, and the aggregate scores normalized by dividing them by the total firm yield of the respective State Water Plan strategies (Table 6-5), and again by the average score of the seven State Water Plans.

Endangered and Threatened Species

The potential impacts of the individual water management strategies were first evaluated with respect to state- or federally-listed endangered and threatened species, federal candidate species and state species of concern, using a two-part index system. First, each species was assigned a score that reflected its status — 1 for state species of concern or federal candidate species; 2 for threatened; or 3 for endangered. In cases where status varies among state and federal agencies, the higher status was used. This analysis included current county species lists produced by TPWD and mapped occurrences of endangered and threatened species within Region L obtained from the TPWD Natural Diversity Database.

Each water management strategy was then evaluated with respect to its potential impact on the species present by assigning a numerical value from zero (0) to three (3) to each instance in which construction or operational disturbances could result in an impact to one of these species according to the following criteria:

0 - No adverse impact expected, or project in historic range only;

1 - Species known to occur within county, but not likely to be impacted;

2 - Species or potential habitat known to occur within the project area, may impact habitats or individuals of widespread species; or

3 - Species or habitat present within the project area, significant reductions in critical habitat or population of endemic species possible.

Each potential impact score was then multiplied by the status score to obtain a final impact assessment for that species and strategy. Status, potential impact, and impact assessment scores are shown in the Endangered, Threatened, and Species of Concern tables in the respective water management strategy discussions in Chapter 5.2 (Volume II). The summed impact assessment scores are listed, and the overall endangered and threatened species impact values for each of the State Water Plans are presented in Table 6-5.

The potential impacts to endangered and threatened species associated with the seven State Water Plans are compared in Figure 6-20, which indicates a higher potential for impacts to occur in the 2017 State Water Plan. This finding is a direct result of the changing nature of the water management strategies; many small projects requiring long pipelines that cross numerous ecologically distinct areas, and those constructed in regions where many protected species occur will have more project facilities adjacent to sensitive species and habitats, and thus higher impact potential, than larger, more compact projects that are not located in areas of many protected species. In Table 6-5, the highest impact scores go to the water management strategies located in areas of relatively high protected species density and the projects requiring the longest pipelines.

Figure 6-20 Cumulative Potential Impact Scores for Endangered, Threatened, and Species of Concern

Vegetation and Wildlife Habitats

To evaluate potential impacts on vegetation and wildlife habitats, each of the water management strategies was given a "total adjusted impact value" based on the area of each habitat type disturbed by construction activities and the level of potential impacts on those resources. For each water management strategy, the total land area potentially disturbed was divided into categories based on types of disturbance. For example, inundation of land due to the construction of a reservoir versus the temporary construction corridor of a pipeline easement. The potential level, or severity, of impacts to vegetation and wildlife was evaluated by assigning an expected impact score:

1 - Low impacts = temporary habitat disturbance (e.g., a pipeline construction corridor);

2 - Medium impacts = permanent or continuing habitat disturbance that does not entirely destroy its original ecological functions; or

3 - High impacts = habitat is permanently removed through inundation or construction.

The area of each type of disturbance was then divided into four categories of habitat type with corresponding scores reflecting their relative values (e.g., forests and wetlands are generally considered more important ecologically than grassland types):

- 1 0-30% canopy cover (grasslands, shrub land and cropland);
- 2 31-70% canopy cover (brush lands, and parkland);
- 3 70-100% canopy cover (woods and forestland); or
- 4 All wetland and wooded riparian areas regardless of canopy cover.

These four categories were based on a clustering of the eight Physiognomic Regions of vegetation provided by the TPWD.²⁴ A digital map of the vegetation types of Texas was then situated over the project area and used to determine the proportions of the four habitat categories potentially affected by each water management strategy.

The product of the level of impact score times the habitat value score times the acreage affected is the adjusted impact value. Adjusted impact values are summed for the habitats potentially affected by each water management strategy and overall vegetation and habitat scores are shown in Table 6-6. Figure 6-21 presents a graphical comparison of seven State Water Plans. These results are clearly the opposite of those obtained above for protected species; the 2016 SCTRWP (2017 State Water Plan) exhibits a lesser impact to this environmental resource category than earlier state water plans. In this case, the large areas to be inundated in the storage reservoir projects recommended in the 1984 to 1997 State Water Plans eliminated large areas of terrestrial and flowing aquatic habitat, replacing them with a lake-type environment.

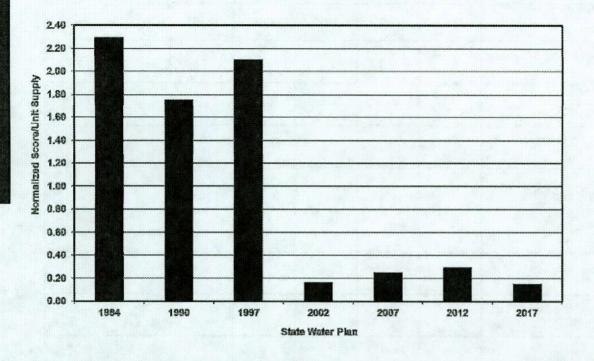

Figure 6-21 Cumulative Potential Impact Scores for Vegetation and Wildlife Habitats

Water Quality and Aquatic Habitats

Potential impacts to water quality and aquatic habitats were assessed in a single stage as each water management strategy was evaluated with respect to a list of eight potential impact classes and assigned an appropriate score for each occurrence of the eight evaluation categories:

(1) Inundation/Conversion of lotic to lentic habitat: Score =1;

(2) Streamflow reductions: Score=1, or 0.25 if compliant with environmental flow standards;

(3) Alteration of flood frequency (below storage reservoirs): Score=1;

(4) Alteration of physio-chemical characteristics of streamflow: Score=1, or 0.25 if compliant with environmental flow standards;

(5) Blocks aquatic migration (any dam on a perennial stream): Score=1;

(6) Alteration of annual hydrograph: Score=1, or 0.25 if compliant with environmental flow standards;

(7) Construction disturbances: Score=1 each for outfalls, intakes, pipeline stream crossings, or dams (maximum value of 4); and

(8) Bay and Estuary inflows: Score=1, or 0.25 if compliant with environmental flow standards.

Scores were tabulated for each water management strategy and summed for each State Water Plan.

The State Water Plans were also scored on the net flow impacts following implementation of all recommended water management strategies on major streams at selected locations. Net flow impact scores were based on the following scale, with the greatest impact score being associated with the greatest potential change in streamflow or freshwater inflow:

0 - Flow increase or no change at low (less than 50th percentile), no change or minor decrease at high flows;

1 - Moderate decrease at low flows (less than 10 percent between 25th and 50th percentiles);

2 - Moderate decrease at low flows, (greater than 20 percent decrease between 50th and 75th percentiles);

3 - Greater than 10 percent decrease between 25th and 50th percentiles; or

4 - Greater than 10 percent decrease between 25th and 50th percentiles, greater than 20 percent decrease between 50th and 75th percentiles.

The summed water quality/habitat and net stream flow scores for each State Water Plan, divided by the plan yields, were added together and normalized. The results are presented in Table 6-7 and Figure 6-22 is a graphical comparison of the seven water plans. The impact score for the 2016 SCTRWP is in the midrange of the seven water plans.

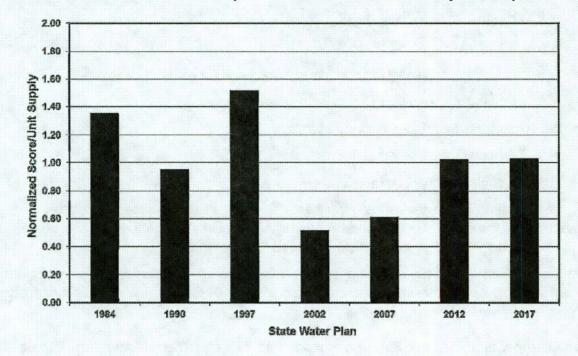

Figure 6-22 Cumulative Potential Impact Scores for Water Quality and Aquatic Habitats

Cultural Resources

Assessment of potential impacts to historical sites included evaluation of data provided by the Texas Historical Commission which included the locations of National Register Districts, National Register Properties, State Historic Sites, Historical Markers, and cemeteries within the state. Possible impacts to these historical sites were determined according to their proximity to the probable construction areas and the type of site, if known. All historical sites within a mile of the pipeline corridor were entered into the impact matrix along with their distances from the project disturbance area and any other details relevant to determining probable impact. Impact scores are based on the following scale, with the greatest impact score being associated with the permanent inundation of any historical site:

- 0 Historical sites mapped greater than 0.50 mile from the project disturbance;
- 1 Historical sites between 0.25 and 0.50 mile from the project disturbance;
- 2 Historical sites less than 0.25 mile from the project disturbance; or
- 3 Permanently inundated historical sites.
- 1 An additional impact point assigned for any cemetery.

Potential impacts to archaeological resources were estimated by compiling the number of proposed disturbances to landforms considered to be of relatively high potential for containing buried archaeological deposits. The high-potential areas were defined as stream terraces bordering both perennial and intermittent streams. A probable impact index was devised which includes factors reflecting the site potential and type of disturbance for each instance of the activity, with the greatest impact score being associated with the permanent inundation of any stream:

For Pipeline Routes the values used are as follows:

- 1.5 Perennial stream crossings;
- 1.0 Intermittent stream crossings;
- 2.5 Construction parallel to perennial stream channels; or
- 2.0 Construction parallel to intermittent stream channels.

For Reservoir Areas the values used are as follows:

- 4.0 Intermittent streams inundated; or
- 5.0 Perennial streams inundated.

For each water management strategy, impact values for historical sites were added to the potential archaeological site impact estimates to arrive at the total impact values shown in Table 6-8. Figure 6-23 presents a graphical comparison of the seven State Water Plans.

The high impact scores for water management strategies which include long pipelines also reflect the large number of stream terrace crossings that will occur as pipelines are constructed across major rivers and their tributaries.

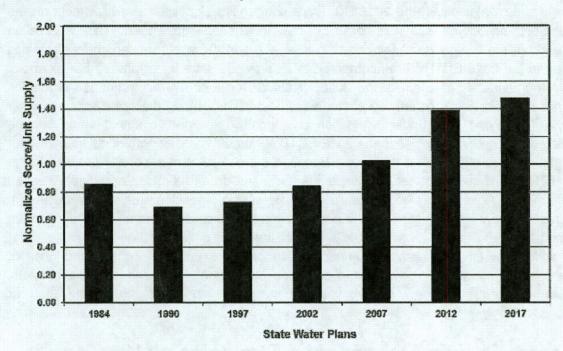

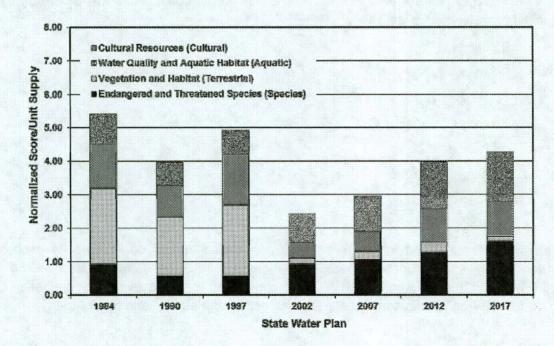

Figure 6-23 Cumulative Potential Impacts to Cultural Resources

Composite Comparison

Figure 6-24 is a composite comparison of the seven State Water Plans aggregating the results of the assessments of the individual environmental resource categories.

Figure 6-24 Cumulative Potential Impact Scores for South Central Texas Regional Water Planning Area

It is apparent from this comparison that, despite avoidance of the large mainstem reservoirs in the early state water plans, the 2016 SCTRWP could have significant overall effects on the environment and cultural resources per unit of new water supply developed. This observation is due, in part, to the greater number and smaller sizes of the water management strategies included in the 2016 SCTRWP as compared to all previous state water plans. For example, the environmental assessment of the 2016 SCTRWP includes 27 recommended strategies while the 1990 plan included only six strategies to develop essentially the same new firm water supply. The broad geographic distribution and lengthy pipelines to key demand centers associated with many strategies in the 2016 SCTRWP create more opportunities to encounter important species and cultural resources. Because the nature of many of the projects in the 2016 SCTRWP is such that actual impacts can be identified and avoided or mitigated based on information from field studies required by permitting agencies, realized impacts are expected to be significantly less than the potential impacts discussed herein. This would not be expected to be the case with respect to the major reservoir projects in the early state water plans, which offer little opportunity for impact avoidance due to inflexibility in size and location, and whose primary impacts (permanent disturbance, inundation of lotic and terrestrial habitats, and concentrated streamflow perturbations) may not be amenable to minimization or compensation.

6.3 Impacts of Water Management Strategies on Key Parameters of Water Quality

In accordance with 31 TAC §357.40(b)(5), the South Central Texas Regional Planning Group (SCTRWPG) must consider the major impacts of recommended water management strategies on key parameters of water quality. Furthermore, the SCTRWPG is to compare conditions with the recommended water management strategies to current conditions using best available data (31 TAC §357.34(d)(8).

The SCTRWPG has selected the following water quality constituents to be considered in a qualitative water quality analysis:

- Chlorides,
- Sulfates,
- Total Dissolved Solids (TDS),
- Dissolved Oxygen (DO),
- pH Range,
- Indicator Bacteria,
- Temperature, and
- Nitrates.

Table 6-9 contains median values for these eight water quality parameters for each of the water supply sources of the water management strategies recommended in the 2016 SCTRWP. In addition, the SCTRWPG has considered the impacts of implementation of the 2016 SCTRWP on recreation, aquatic life, domestic water supply, and agriculture.

Water Source	Chlorides (mg/L)	Sulfates (mg/L)	Total Dissolved Solids (TDS) (mg/L)	Dissolved Oxygen (DO) (mg/L)	pН	Indicator Bacteria (#/100 ml)	Temperature (Deg C)	Nitrates (mg/L)
Edwards Groundwater	20	18	321	6.2	7.4	0	21	0.9
Gonzales-Carrizo Aquifer	23	39	248	0.0	7.5	0	35	<0.1
Bexar-Carrizo Aquifer	37	27	190	0.0	6.1	0	26	<0.1
Bastrop/Lee- Simsboro Aquifer	23	54	121	0.0	7.3	0	24	<0.1
Bexar-Wilcox Aquifer	145	258	1200	1.0	7.6	0	21	0.6
Trinity Aquifer	23	37	294	1.0	7.5	0	23	1.0
Gulf Coast Aquifer	253	90	877	2.0	7.8	0	29	0.5
San Antonio River	120	110	610	7.9	7.9	194	23	3.9
Cibolo Creek	71	47	530	6.2	7.6	91	25	5.4
uadalupe River	31	36	380	7.6	7.9	100	23	1.1
Lavaca River	40	16	490	7.9	8.1	160	23	0.2

Table 6-9 Median Values of Key Parameters of Water Quality

Potential water quality impacts considered herein are associated with source and receiving water characteristics, treatment requirements, blending compatibility, and treated effluent quality and quantity. For the purposes of this general assessment, it is assumed that wastewater treatment standards and plant performance will continue to improve over time. Other applicable assumptions are consistent with those described in Chapter 6.1 regarding cumulative effects of regional water plan implementation.

Table 6-10 summarizes a general qualitative assessment of the potential impacts of the implementation of recommended water management strategies on the key parameters of water quality listed above. Each water quality parameter was assigned an impact level associated with the implementation of each recommended water management strategy. A value of '0' is used to indicate that no impacts are expected; a value of '1' indicates minimal impacts are expected; a value of '2' indicates moderate impacts are expected; and a value of '3' indicates severe impacts are expected from the implementation of the water management strategy. As it is understood that any future wastewater discharges, potable water deliveries, and/or recycled water use will be in compliance with TCEQ requirements, water quality impact scores presented herein may be viewed as relative indicators of concern or risk among water quality parameters potentially affecting or affected by a project.

Table 6-10 Impacts of Recommended Water Management Strategies on Key Parameters of Water Quality

In general, the water management strategies recommended for implementation are expected to have little, if any, measurable impacts on water quality. Only three of the recommended water management strategies score as high as a '2' for any water quality parameter. These three strategies are the Victoria County Steam-Electric Project (temperature), GBRA Integrated Water Power Project (chlorides), and SAWS Seawater Desalination (chlorides). Only the Brackish Groundwater strategies received scores (though none greater than '1') in four or more of the key water quality parameters. 36 percent of the recommended water management strategies received a score of zero (no impacts expected) and 73 percent received a score greater than zero in two or less of the key water quality parameters. It is anticipated that none of the recommended water management strategies will have associated effects on water quality sufficient to impact recreation or instream aquatic life uses to a significant degree.

The SCTRWPG has addressed the potential effects of 2016 SCTRWP implementation on recreation and aquatic life through application of the environmental flow standards adopted by the TCEQ in the technical evaluation of surface water management strategies involving new appropriations. The cumulative effects analyses (Chapter 6.1) and environmental assessment (Chapter 6.2) also provide information relevant to potential effects of plan implementation on recreation and aquatic life.

Thirteen (13) strategies could potentially impact domestic water use and agricultural water use: Drought Management, Carrizo Conversions, Edwards Transfers, Recycled Water Programs, Surface Water Rights, Hays/Caldwell PUA Project, TWA Regional Carrizo, Expanded Local Carrizo for SAWS, CRWA Wells Ranch Project, Carrizo Aquifer for CVLGC, Vista Ridge Consortium, Regional Carrizo for SSLGC Project Expansion, and/or Hays Forestar. Two other strategies may provide benefits to domestic and/or agricultural water use: Municipal Water Conservation and/or GBRA Lower Basin Storage.

6.4 Impacts of Voluntary Redistribution of Water from Rural and Agricultural Areas

Similar to third-party impacts of voluntary redistribution, the Regional Water Plan shall include a quantitative reporting of socioeconomic impacts on agricultural resources including analysis of third-party gross business activity and employment impacts of moving water from rural and agricultural areas.²⁵ In this case, voluntary redistribution is the acquisition of water by willing buyers from willing sellers, subject to conditions of existing groundwater management plans and rules of Groundwater Conservation Districts, in the case of groundwater supplies, and subject to existing surface water permits and water available from such permits (see Chapters 3.1 and 3.2 for descriptions of methods used in determining quantities of groundwater and surface water available to meet projected water demands in the SCTRWP).

In the development of the SCTRWP, the following principles have been followed: (1) water conservation has been the first water management strategy recommended to meet projected needs (shortages) of water user groups (WUGs); and (2) all other recommended water management strategies including movement of water from rural and agricultural areas must be based on the voluntary transfer concept, as will be further explained below. The water management strategies of the 2016 SCTRWP were selected and sized in compliance with Desired Future Conditions (DFCs) and Modeled Available Groundwater (MAG) so as to limit impacts upon the supplies of water projected to be needed for use in rural and agricultural areas. In addition, the costing of each water management strategy includes estimated payments to landowners from which groundwater would be obtained and to holders of surface water rights to clearly reflect that implementation of these water management strategies would include compensation of the owners of the water by those who would obtain and use the water (i.e., the willing seller willing buyer condition underlying the voluntary transfer concept).

²⁵ It is important to note that the most likely places from which water can be obtained to meet the needs of municipalities and other water users of the South Central Texas Region are rural areas, many of which are also agricultural areas.

Major recommended water management strategies of the SCTRWP that may involve voluntary redistribution of water from rural and agricultural areas within Region L are listed as follows, along with the portion of the firm new supply potentially considered a voluntary redistribution:²⁶

Total	107,632 acft/yr
Regional Carrizo for SSLGC Project Expansion	<u>5,720 acft/yr</u>
CRWA Wells Ranch Project	7,829 acft/yr
CVLGC Carrizo Aquifer w/ Conversions	10,000 acft/yr
Hays Forestar	12,356 acft/yr
TWA Regional Carrizo	15,000 acft/yr
Hays/Caldwell PUA Project	21,833 acft/yr
Vista Ridge Consortium	34,894 acft/yr

In total, up to 108,000 acft/yr of water from rural and agricultural areas in the 2016 South Central Texas Regional Water Plan may be used for other purposes in more urban areas in the future. In addition, up to 11,786 acres of agricultural lands may be affected by recommended water supply projects.

With the exception of the SSLGC strategy above, the associated quantities are limited by MAG and the sponsors have expressed interest in increasing the firm yield of each strategy if DFCs are changed and MAG increases.

Source counties for the water management strategies (WMS) listed above have projected needs for additional water supply (or have projected surpluses less than the volume associated with the listed WMS) so third-party economic impacts of transfers may occur as future supplies alternative to local groundwater are developed. Implementation of the recommended water management strategies would result in: (1) drawdown of the water table, increasing local area pump lifts in the aquifer areas from which groundwater would be obtained; and would (2) provide payments to landowners for groundwater and to holders of surface water permits for use of surface water at rates negotiated between buyer and seller. In addition, implementation of recommended water management strategies can be expected to result in construction and associated expenditures in local areas where such projects are constructed, but neither the economic benefits of such expenditures, nor the subsequent economic development that might result from such expenditures are estimated due to lack of information pertaining to such activities.

Although it is not possible to estimate total costs of any additional pump lifts or deepening of wells resulting from implementation of recommended water management strategies in the SCTRWP due to lack of information about location and numbers of wells that might be affected, estimates for a single family home range from less than \$2.00 per year, where additional lift might be 25 feet, to less than \$10.00 per year if lift is increased by 150 feet.

²⁶ Surface Water Rights is not included as supply quantities are not specified.

6.5 Social and Economic Impacts of Not Meeting Projected Water Needs

Section 357.4(a) of the rules for implementing Senate Bill 1 requires that the social and economic impacts of not meeting regional water supply needs be evaluated by the SCTRWPG. The TWDB is required to provide technical assistance, upon request, to complete the evaluations. The SCTRWPG requested technical assistance of the TWDB to perform the required analyses and the estimated socio-economic impacts of projected water shortages are presented in Appendix F. In summary, Region L could experience \$1.99 billion in income losses and almost 18,300 job losses in 2020 if no water management strategies are implemented to meet projected shortages. These potential income losses in 2020 are allocated among water use sectors as follows: municipal (9%), manufacturing (36%), irrigation (2%), mining (46%), and steam-electric power generation (7%). Similarly, Region L could experience \$5.91 billion in income losses and about 50,100 job losses in 2070 if no water management strategies are implemented to meet projected shortages. These potential income losses in 2070 are allocated among water use sectors as follows: municipal (27%), manufacturing (37%), irrigation (<1%), mining (<1%), and steam-electric power generation (35%). Table 6-11 summarizes the needs that remain unmet in the 2016 SCTRWP after implementation of recommended water management strategies. These long-term unmet needs are expected to occur only in the irrigation and mining water use sectors. As shown in the TWDB socio-economic impact analyses, however, these unmet irrigation and mining needs would represent only 1.1% of the potential income losses in 2070 considering projected shortages in all water use sectors.

*WUG supplies and projected demands are entered for each of a WUG's region-county-basin divisions. The unmet needs shown in the WUG Unmet Needs report are calculated by first deducting the WUG split's projected demand from the sum of its total existing water supply volume and all associated recommended water management strategy water volumes. If the WUG split has a greater future supply volume than projected demand in any given decade, this amount is considered a surplus volume. In order to display only unmet needs associated with the WUG split, these surplus volumes are updated to a zero and the unmet needs water volumes are shown as absolute values.

6.6 Effects on Navigation

None of the water management strategies recommended for implementation in the 2016 SCTRWP are expected to have any direct effects on navigation. Any saltwater intake, brine disposal, or water transmission pipelines associated with the GBRA Integrated Water Power Project, SAWS Seawater Desalination, or Victoria County Steam-Electric strategies will avoid or be buried beneath shipping lanes.

6.7 Environmental Benefits and Concerns

The South Central Texas Regional Water Planning Group has identified the following significant environmental benefits and concerns associated with the implementation of the 2016 SCTRWP.

6.7.1 Environmental Benefits

- Emphasis on conservation, drought management, reuse, groundwater development, and use of existing surface water rights avoids or delays projects with greater impacts.
- Implementation of the Edwards Aquifer Habitat Conservation Plan and development of non-Edwards supplies contribute to springflow maintenance and endangered species protection.
- Plan avoids impacts associated with development of new mainstem reservoirs.
- Increased reliance on Aquifer Storage and Recovery (ASR) facilitates storage during wet periods for use during dry periods without evaporation and terrestrial habitat losses.
- Long-term reliance on seawater desalination is perceived to have fewer associated impacts than development of new (fresh) surface water supplies.

- Reductions in instream flows and freshwater inflows to bays and estuaries associated with surface water supply and direct consumptive reuse projects.
- Projects located in stream segments identified by TPWD as ecologically significant.²⁷
- Effects on small springs and reductions in flux entering streams from aquifers associated with groundwater development.
- Intake siting, brine disposal, and effects on marine species and habitat associated with seawater desalination projects.

²⁷ Segments and projects are summarized as follows:

Lower Guadalupe River – GBRA Lower Basin New Appropriation, Victoria County Steam-Electric Project, GBRA Lower Basin Storage, Victoria ASR, Victoria Groundwater – Surface Water Exchange

Middle Guadalupe River – GBRA Mid-Basin Project (ASR), SSLGC Expansion Carrizo Aquifer (Guadalupe County)

Lower San Marcos River – San Marcos Direct Reuse, HCPUA Project, TWA Carrizo Project

7 Drought Management

Droughts are of great importance to the planning and management of water resources in Texas. Although droughts can occur in all climatic zones, they have the greatest potential to become environmental disasters in dry or arid regions such as Texas. It is not uncommon for mild droughts to occur over short periods of time in Texas; however, there is no concrete way to predict how long or severe a drought will be while it is occurring. The only defense available to drought prone Water User Groups (WUGs), such as those in Region L, is proper planning and preparation for worst case scenarios. This requires understanding of drought patterns and the historical droughts in the region.

Due to significant population growth throughout Texas, which is expected to continue in the Region L area based on TWDB projections, the demand for water has increased. With growing demand and the threat of climate change contributing to water scarcity, planning is even more important to prevent shortages, deterioration of water quality and lifestyle/financial impacts on water suppliers and users. This chapter presents information on Region L's drought preparedness including; regional droughts of record, current model drought contingency plans, emergency interconnects, and responses to local drought conditions.

7.1 Droughts of Record in the RWPA

7.1.1 Background

One of the best tools in drought preparedness is a thorough understanding of the drought of record (DOR), or the worst drought to occur for a particular area during the available period of record. However, there are many ways that the "worst drought" can be defined (degree of dryness, agricultural impacts, socioeconomic impacts, effects of precipitation, etc.). Regional water planning focuses on hydrological drought which is typically the types of drought associated with the largest shortfalls in surface and/or subsurface water supply. The frequency and severity of hydrological drought is often defined on a watershed or river basin scale, although it could be different from one area to the next, even within a planning region.

7.1.2 Current Drought of Record

In terms of severity and duration, the devastating drought of the 1950s is considered the drought of record for most of the state including the Region L planning area. By 1956, 244 of the 254 counties were considered disaster areas. This drought lasted almost a decade in many places and not only affected Texas, but other states throughout the nation as well. The 1950's drought has been used by water resource engineers and managers as a benchmark drought for water supply planning since the regional water planning process was implemented. Two recent droughts centered around 2008 and 2011 have been discussed but not widely accepted as potential new droughts of record for parts of the state.

For the Guadalupe-San Antonio River Basin within Region L, the drought of the 1950s remains the drought of record. In the upper portions of the river basin, the 1950's drought generally started in summer of 1947 and continued into early 1957. In the lower basin area near the Gulf Coast, the drought generally was a 3-year period between 1954 and 1956.

Until recently the 1950s drought was the drought of record for the Nueces River Basin as well. However, the 1990s drought was severe and prolonged enough that many believe it should be considered the new drought of record.

7.1.3 Drought Indicators

Water Availability Modeling

Engineers and planners often use surface water models to demonstrate the effects of historical droughts on water supply. Surface water effects are more readily observed than groundwater and reservoir supplies that were not built before historic droughts can be assessed using historic hydrology. The primary tool used to observe the performance of Region L reservoirs under historic drought conditions is TCEQ's Guadalupe-San Antonio River Basin Water Availability Model (GSA WAM). The GSA WAM is the same tool used to determine the available flow and firm yields of surface water projects in the RWP.

The GSA WAM model includes hydrologic information from 1934 through 1989 and supports the use of the 1950's drought as the drought of record for all Region L reservoirs. However, it has not been updated to include information from more recent periods of drought.

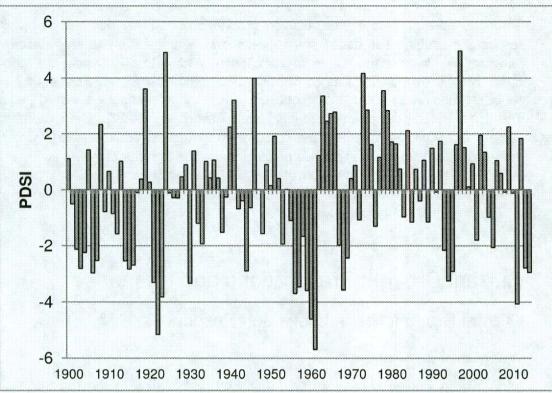

Drought Indices

Several Drought Indices have been developed to assess the effect of a drought through parameters such as severity, duration and spatial extent. The Palmer Drought Severity Index (PDSI) was one of the first comprehensive efforts using precipitation and temperature for estimating the moisture of a region. PDSI values greater than 0.49 correspond to wetter than normal conditions and values from -0.5 to 6 represent varying degrees of drought. Information is available for climate regions across the country through 2014, which makes the PDSI a helpful tool for analyzing droughts, not included in the GSA WAM.

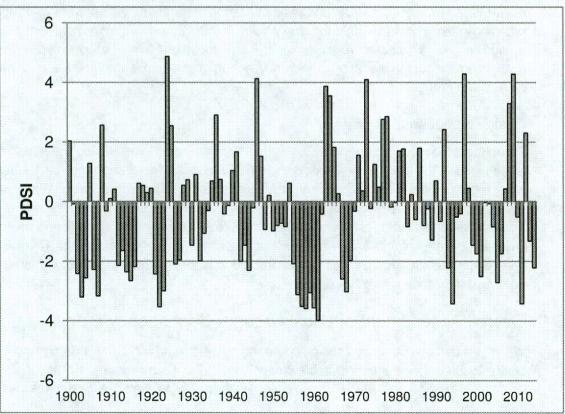

Most of Region L lies in Texas Climate Divisions 7 and 9. A graph of yearly PDSI values for Texas Climate Division 7 and 9 show that while the 1908 and more recent drought in the early 21st century were severe, the drought of the 1950's was the most intense over a longer period of time, supporting the continued use of this drought as the drought of record for Region L (Figure 7.1-1).

2016 South Central Texas Regional Water Plan Volume I

7.1.4 Recent Drought Discussion

Throughout the 2011 water year, a severe drought occurred from decreased precipitation resulting in substantial declines in streamflow throughout the state. Record high temperatures also occurred June through August leading to an increase in evaporation rates. The net evaporation was so high that by August 4, 2011, state climatologist John Nielson-Gammon declared 2011 to be the worst 1-year drought on record in Texas¹. The 2011 water year statewide annual precipitation was 11.27 inches, more than 2 inches below the previous record in 1956 of 13.91 inches. While the 2011 water year drought was severe and can provide helpful information to water planners and managers throughout the state, the duration of the 1950's drought combined with the over all severity for almost a decade in region L suggests that it is still the best choice as the DOR for regional planning purposes.

7.2 Current Drought Preparations and Response

7.2.1 Current Drought Preparations and Responses

WUG Level Planning

All WUGs in Region L prepare for drought by participating in the regional planning process. The regional planning process attempts to meet projected water demands during a drought of severity equivalent to the drought of record. WUGs that provide accurate information to TWDB and consider recommendations accepted by the regional planning group should be able to supply water to customers throughout drought periods. In addition, all wholesale water providers and most municipalities develop individual drought contingency plans or emergency action plans to be implemented at various stages of a drought.

Basin Responses

Throughout Texas including the Guadalupe-San Antonio River Basin, water rights are issued under the prior appropriation system. During times of shortage, curtailment of water rights has become necessary in recent droughts. The South Texas Watermaster Program is responsible for managing surface water rights in an area in south central Texas based on "run of the river" rights. The program has jurisdiction over the Guadalupe-San-Antonio and Nueces River Basins, as well as the Lavaca River Basin. Five watermaster deputies will patrol the 50 counties in the jurisdictional area and enforce compliance with water rights.

7.2.2 Overall Assessment of Local Drought Contingency Plans

While you can not perfectly predict the timing, severity and length of a drought, you can safely assume that it is an inevitable component of the Texas climate. For this reason, it is critical to plan for these occurrences with policy outlining adjustments to use,

¹ Winters, K.E., 2013, A historical perspective on precipitation, drought severity, and streamflow in Texas during 1951–56 and 2011: U.S. Geological Survey Scientific Investigations Report 2013–5113, p.1 http://pubs.usgs.gov/sir/2013/5113

allocation, and conservation in response to drought conditions. Drought and other circumstances that interrupt the reliable supply or water quality of a source often lead to water shortages. When a water shortages occurs there is generally a greater demand on the already decreased supply as individuals attempt to keep lawns green etc. If this behavior is unaddressed there can be an increase in the rate of water supply depletion.

TCEQ requires all wholesale public water suppliers, retail public water suppliers serving 3,300 connections or more, and irrigation districts to submit drought contingency plans (DCPs). In accordance with the requirements of Texas Administrative Code §288(b), DCPs must be updated every 5 years and adopted by retail public water providers. The TCEQ defines a DCP as "A strategy or combination of strategies for temporary supply and demand management responses to temporary and potentially recurring water supply shortages and other water supply emergencies."² According to a TCEQ handbook³ the underlying philosophy of drought contingency planning is that:

- While often unpreventable, short-term water shortages and other water supply emergencies can be anticipated,
- The potential risks and impacts of drought or other emergency conditions can be considered and evaluated in advance of an actual event; and, most importantly,
- Response measures and best management practices can be determined with implementation procedures defined, again in advance, to avoid, minimize, or mitigate the risks and impacts of drought-related shortages and other emergencies.

Model Drought Contingency plans are available on TCEQ's website; however, it is not possible to create a model DCP that will adequately address local concerns throughout the State of Texas. The conditions that define a water shortage can be very location specific because most communities in Region L rely primarily on local water supplies. For example, some communities rely on reservoirs that are regularly operated at full conditions; in this case a shortage could exist when the supplies are at 75 percent. Other reservoirs may rarely refill and be considered a concern at 25 percent capacity. Similarly, unique aquifer systems are considered at risk under location specific conditions. While the approach to planning may be different between entities all DCP's should include:

- Specific, quantified targets for water use reductions,
- Drought response stages,
- Triggers to begin and end each stage,
- Supply management measures,
- Demand management measures,
- Descriptions of drought indicators,
- Notification procedures,
- Enforcement procedures,
- Procedures for granting exceptions,

² http://www.twdb.texas.gov/conservation/training/archives/more-than-a-drop-workshop/doc/5_%20TCEQ%20Rules.pdf

³ https://www.tceq.texas.gov/assets/public/comm_exec/pubs/archive/rg424.pdf

- Public input to the plan,
- Ongoing public education,
- Adoption of plan, and
- Coordination with regional water planning group.

For water suppliers such as those in Region L, the primary goal of DCP development is to have a plan that can ensure an uninterrupted supply of water in an amount that can satisfy essential human needs. A secondary but also important goal is to minimize negative impacts on quality of life, the economy and the local environment. In order to meet these goals, action needs to be taken quickly which is why an approved DCP needs to be in place before drought conditions occur.

In accordance with Texas Administrative Code (*Title 30 §288*), most Region L entities have submitted DCPs to TCEQ for implementation when local shortages occur. Region L was able to obtain DCPs for 17 WUGs and WWPs. These plans identify multiple triggers for initiation and termination of drought stages, responses to be implemented and reduction targets based on each stage. The plans also include information regarding public notification procedures and enforcement measures. Some WUGs or WWPs have included a method of granting a variance should the need arise. The most recent DCPs for each entity in Region L range in date from 2013 to 2015.

7.2.3 Summary of Existing Triggers and Responses

Through timely implementation of drought response measures, it is possible to meet the goals of the DCP by avoiding, minimizing, or mitigating risks and impacts of water shortages and drought. In order to accomplish this, DCP's are built around a collection of drought responses and triggers based on various drought stages. Stages are generally similar for all DCP's but can vary from entity to entity. Stage one will normally represent mild water shortage conditions and the severity of the situation will increase through the stages until emergency water conditions are reached and in some cases a water allocation stage is determined.

Region L compiled stage, trigger, and response information for 17 DCP's in the region including those from WWPs, WUGs and County-Other suppliers. The majority of the DCPs in the region have a Voluntary Stage I and Mandatory Stage II and III categories. Most Entities included a Stage IV, and a few entities specified a Stage V and/or Stage VI scenario. Target reductions, triggers and responses are included for most stages. Triggers and responses for Region L entities can be found in Appendix I.

7.3 Existing Interconnects

A goal of the regional planning process is to ensure a connected supply that meets or exceeds drought of record demands for the next 50 years. However, it is also important for regions to plan for emergency supplies in the event of a prolonged drought or an interruption/impairment of supply from an existing source. An interconnection between two collaborating municipal water user groups (WUGs) can serve as an alternative means of providing emergency drinking water in lieu of trucking in supply or other expensive options. In Compliance with Texas Administrative Code (TAC), Chapter 357

Regional Water Planning Guidelines, available information on existing major water infrastructure facilities that may be used for interconnections in event of an emergency shortage of water was collected.

For the Region L Water Planning Area, all municipal water user groups were sent a survey in 2013 regarding their water supply and use. As part of the survey, individual municipalities were asked to confirm or update information regarding the existence of emergency interconnects integrated with their system and the provider of the potential emergency supply. Of the 119 Municipal WUGs in Region L, 16 responded to the survey and only five reported having emergency interconnects. A second e-mail survey based on the template provided by the TWDB in the First Amended General Guidelines for Development of the 2016 RWPs was sent in 2015 to wholesale water providers and major municipal centers. Three entities returned the email survey contributing an additional seven emergency interconnects.

An interconnection study was completed by HDR for the Regional Water Alliance⁴ (RWA) in 2009 that compiled information regarding existing interconnections and proposed several potential interconnections across the region. Of the 8 existing interconnects identified in this study, 5 had known pipe diameters. The TCEQ Texas Drinking Water Watch database (TCEQ database) was used as a final source of emergency interconnection information. 18 interconnects were noted from the TCEQ database bringing the total to 35 reported emergency interconnects from 4 sources. While this should not be considered a comprehensive list, it is the extent of information available at this time. Information on existing and potential interconnect supply capacity or location was not available from any source. Information on existing and potential interconnect supply source or location was not available from the surveys and reports available. In accordance with Texas Water Code §16.053(r) the information gathered is considered confidential and was submitted to the executive administrator, but not included in the regional plan.

7.4 Emergency Response to Local Drought Conditions or Loss of Municipal Supply

The regional and state water plans aim to prepare entities for worst case drought scenarios based on the drought of record as described in Chapter 7.1. However, entities may find themselves in a local drought or facing a loss of municipal supply. While rare, it is important to have a back up plan in case of infrastructure failure or water supply contamination. This is especially important for smaller entities that rely on a sole source of supply. While many entities and wholesale water providers have DCP's as described in Chapter 7.2, it is less common for small municipalities or county-other WUGs to have these emergency plans. An analysis of a broad range of emergency response options was performed for small WUGs with 2010 Census populations less than 7,500 and a sole supply source as well as for all County-Other WUGs in the Region.

A WUG relying on groundwater is considered sole source if all its supplies come from the same aquifer regardless of varying groundwater districts or combination of contractual and local development supplies. A WUG relying on surface water is considered sole

⁴ HDR, "Regional Water Alliance Water System Interconnection Study", 2009.

source if their supply comes from one river intake or one reservoir, regardless of the number of contracts in place. A WUG with contract with most WWPs was not considered sole-source due to various supplies held by the WWPs. WUGs with both groundwater and surface water supplies were not included, with the exception of county-other entities.

A broad range of emergency situations could result in a loss of reliable municipal supply and it is not possible to plan one solution to meet any possible emergency, for that reason a range of possible responses were selected for each entity based on source type and location. WUGs were analyzed for potential additional fresh water and brackish water wells based on the existence of appropriate aquifers in the area. MAG availability was not considered since the wells are assumed temporary over the course of an emergency. WUGs with nearby surface water were analyzed for curtailment of junior water rights and for releases from upstream reservoirs. Additional yield availability was not analyzed for reservoir releases as in the case of a temporary, localized emergency, special arrangements can be made.

A nearby entity that could provide supply in the case of an isolated incident was identified for applicable WUGs and existing interconnects were noted if information was available. In addition, trucking in water was considered as a supply option under severe circumstances. Any infrastructure required for implementation of the options is also reported. A total of 72 entities were analyzed including 21 county-other WUGs. The results of this analysis are included in Table 7.4-1.

Table 7.4-1 Summary of Emergency Supply Options

2016 South Central Texas Regional Water Plan Volume I

7.5 Region Specific Drought Response Recommendations and Model Drought Contingency Plans

Region L acknowledges that DCPs are a useful drought management tool for entities with both surface and groundwater sources and recommends that all entitles consider adopting a DCP in preparation for drought conditions. The region also recommends that in accordance with TCEQ guidelines, entities update their DCPs every 5 years as triggers can change as wholesale and retail water providers reassess their contracts and supplies. Region L obtained 17 drought contingency plans from across the region. Six of these participating water providers and WUGs rely solely on surface water, one entity relied solely on groundwater and 10 of them utilize both sources to meet needs.

7.5.1 Drought Response Recommendations for Surface Water

Surface water accounts for approximately 16 percent of 2020 existing municipal supplies in Region L and is sold by five wholesale water providers. With such a variety of supply sources, it is difficult to create a set of triggers and responses that will fit the needs of each WUG in the regional planning area. Region L recognizes that supplies are understood best by the operators and suggests that WUGs without DCPs look to the DCPs of their water providers for these surface supplies.

For entities without DCPs supplying themselves with local surface water, Region L suggests reviewing the drought responses and recommendations used by similar entities in the region. An example of triggers and responses from the DCP for GBRA is presented below (Table 7.5-1). GBRA was selected as a representative example because they provide water to several entities throughout Region L and rely on various types of surface water triggers that can be applied throughout the Region. The DCP includes four water stages ranging from "Mild Water Shortage" to "Emergency Water Shortage". The triggers depend on parameters such as storage levels, reservoir elevations, and system failures. The responses include categories ranging from home irrigation limits to pool and fountain restrictions.

Drought Stage	Trigger	Actions
Stage I – Mild Water Shortage	 * Canyon reservoir is less than or equal to EL. 895 ft-msl * Comal Springs 24 hr. flow rate flow rate is at or below 250 cfs * Production at Luling WTP is 2.5MGD or greater for 7 days *Flow at USGS #08172000 drops below 130 cfs 	 No person may waste water No person may wash an impervious outdoor ground covering No person may use water for landscaping between 10 am and 8pm unless by hand help device or recycled water Swimming pools must be at least 25% covered by an evaporative shield when not in use Vehicles may only be washed at commercial locations or Monday and Friday before 10am or after 8 pm
Stage II – Water Warning	 * Canyon reservoir is less than or equal to EL. 890 ft-msl * Comal Springs 24 hr. flow rate flow rate is at or below 200 cfs * Flow at USGS #08172000 drops below 80cfs 	 All Stage I Actions Irrigation limited to designated days 3 days a weeks during restricted hours unless hand held device used Vehicle washing is only permissible by using a five gallon container and/or a hand held hose equipped with a quick shutoff nozzle on designated watering days or at a commercial location. Water may not be used for ornamental fountains unless recycled
Stage III – Water Emergency (severe)	* Canyon reservoir is less than or equal to EL. 885 ft-msl *Comal Springs 24 hr. flow rate flow rate is at or below 150 cfs *Flow at USGS #08172000 drops below 40 cfs	 All Stage I and II Actions Irrigation limited to designated days 2 days a weeks during restricted hours unless hand held device used Water may not be used for ornamental fountains Vehicle washing is only permissible by using a five gallon container and/or a hand held hose equipped with a quick shutoff nozzle on designated watering days or at a commercial location.
Stage IV – Water Crisis (critical/ emergency)	 * Loss of capability to provide water service * Contamination of supply source * Drought of greater severity than the DOR *Comal Springs average 24 hr. flow rate flow Rate is at or below 100 cfs * Water ceases to flow past Zedler Dam 	 All Stage I, II and III Actions Irrigation limited to designated days 1 days a weeks during restricted hours unless hand held device used Filling of new and existing pools is prohibited Vehicle washing is only permissible at a commercial location.

Table 7.5-1 Example Surface Water Drought Contingency Plan Based On GBRA

7.5.2 Drought Response Recommendations for Groundwater

Groundwater accounts for approximately 84 percent of 2020 existing municipal supplies. Entities in Region L utilize both brackish and non-brackish wells in four major formations. With such a variety of supply sources it is difficult to create a set of triggers and responses that will fit the needs of each WUG in the regional planning area. Region L recognizes that supplies are understood best by the operators and suggests that WUGs without DCPs look to the DCP's of their water providers for these surface supplies.

For entities without DCPs supplying themselves with local groundwater, Region L suggests reviewing the drought responses and recommendations used by similar entities

in the region. An example of triggers and responses from the DCP for SAWS is presented below (Table 7.4-1). SAWS was selected as a representative example because they are the largest provider of Groundwater to Region L. The DCP includes four water stages. The triggers depend on parameters such as supply and well levels. The responses include categories ranging from residential irrigation limits to commercial and irrigation use reductions.

Table 7.4-1 Based On SAWS

Drought Stage	Trigger	Actions
Stage I	Edwards Aquifer Level in the Index well J-17 falls to 660 ft msl.	 Irrigation limited to 1 day a week at restricted times unless by hand held device. Cites encouraged to reduces water main flushing and to implement leak detection and survey repairs Voluntary reduction on power production water Pools must be covered by at east 25% evaporation block when not in active use. Aesthetic water features prohibited No person may wash an impervious outdoor ground covering Golf courses, parks and fields must submit conservation plans Customers are requested to minimize or discontinue non-essential water use.
Stage II	Edwards Aquifer Level in the Index well J-17 falls to 650 ft msl.	 Irrigation limited to 1 day a week at further restricted times unless by hand held device. Hotels must offer "no linen exchange program" Filling of pools is prohibited unless 30% from alternative source Golf Courses have limited watering schedule and are charges surcharge in non-conforming.
Stage III (severe)	*Edwards Aquifer Level in the Index well J-17 falls to 640 ft msl. *Total supply is insufficient to meet demands and comply with regulations	 All actions listed in Stage II Irrigation limited to 1 day every other week at restricted times unless by hand held device. Hand Held watering limited to restricted times and three days a week Hotels must limit linen exchange to once every 3 nights or entire stay. New Landscape is only permitted if less that 50% is turf Golf Course must implement 30% use reduction
Stage IV (critical/ emergency)	After a 30-day monitoring period once stage III is declared, the total supply is insufficient to meet demand while complying with regulations.	 All actions listed in Stages II and III A surcharge is assessed on all irrigation accounts A surcharge is assessed on all residential accounts Only SAWS certified vehicle wash facilities can operate Additional restrictions including but not limited to ban on lawn watering with irrigation systems may be established at discretion of city council.

7.5.3 Model Drought Contingency Plans

TCEQ has prepared model drought contingency plans for wholesale and retail water suppliers to provide guidance and suggestions to entities with regard to the preparation of drought contingency plans. Not all items in the model will apply to every system's situation, but the overall model can be used as a starting point for most entities. Region L suggests that the TCEQ Model DCPs should be used in conjunction with drought contingency measures such as those listed above for Abilene and Thrall for entities wishing to develop a new DCP. The TCEQ model drought contingency plans can be found in Appendix I or on TCEQ's website:

(https://www.tceq.texas.gov/permitting/water_rights/contingency.html/#contents).

7.6 Drought Management WMS

Texas Administrative Code (TAC), Chapter 357 Regional Water Planning Guidelines, states that "Regional water plan development shall include an evaluation of all water management strategies the regional water planning group determines to be potentially feasible, including drought management measures including water demand management [357.7(a)(7)(B)]." As defined here, drought management means the periodic activation of approved drought contingency plans resulting in short-term demand reduction and/or rationing. This reduction in demand is then considered a "supply" source. Using this approach, an entity may make the conscious decision not to develop firm water supplies greater than or equal to projected water demands with the understanding that demands will have to be reduced or go unmet during times of drought. Using this rationale, an economic impact of not meeting projected water demands can be estimated and compared with the costs of other potentially feasible water management strategies in terms of annual unit costs.

A drought management analysis was completed that calculated the potential supply and cost of reducing the 2020 demand by 5, 10, 15 and 20 percent for all entities with needs in 2020. The methodology and results of this analysis can be found in more detail in Chapter 5.2.2. Region L recommends a 5 percent Drought Management strategy for those entities with needs in 2020. Table 7.6-1 shows the recommended 5 percent yield for the 28 entities with 2020 needs and the alternative yields for higher reductions.

Table 7.6-1 Drought Management Firm Yield

San Antonio Water System (SAWS), who does not have a need in 2020, also requested to be included in the drought management analysis. SAWS prefers to utilize a multidecadal approach to Drought Management. SAWS is considering a 5 percent demand reduction for 2020, a 12 percent demand reduction for 2040, and 16 percent demand reductions for 2050-2070. Table 7.6-2 shows the requested reductions and projected yields for SAWS throughout the planning period.

				-		
	2020	2030	2040	2050	2060	2070
% Reduction	5%	12%	16%	16%	16%	16%
Yield (acft)	14,674	38,517	55,536	59,877	64,184	68,190

Table 7.6-2 SAWS Drought Management Analysis

7.7 Other Drought Recommendations

7.7.1 Model Updates

It is of upmost importance that regional water planning groups have the most up to date information available to make decisions. The GSA WAM is used to determine both the drought of record and the firm yield of reservoirs, but has not been updated in almost 20 years. Region L recommends that the Texas Legislature approve a budget for TCEQ to pursue updating WAMs before the next regional planning cycle. This will be especially important if the duration of the recent drought continues or the severity increases.

7.7.2 Monitoring and Assessment

Region L recommends that all entities monitor the drought situation around the state and locally in order to prepare and facilitate decisions. Several state and local agencies are monitoring and reporting on conditions with up to date information. A few informative sources are listed below.

- San Antonio Water System Drought Restrictions: <u>http://www.saws.org/conservation/droughtrestrictions/</u>
- Guadalupe-Blanco River Authority Drought/Conservation: <u>http://www.gbra.org/drought/default.aspx</u>
- TWDB Drought Information: http://waterdatafortexas.org/drought/
- TCEQ Drought Information: <u>https://www.tceq.texas.gov/response/drought</u>
- Parmer Drought Severity Index: <u>http://www.ncdc.noaa.gov/temp-and-precip/drought/historical-palmers/</u>
- Regional Planning Group Information: <u>http://www.regionItexas.org/</u>

In addition, Region L supports the efforts of the Texas Drought Preparedness Council (DPC), as outlined in their 2014 letter to planning groups, and recommends that entities review information developed by the council. The Drought preparedness council was established by the legislature in 1999 and is composed of 15 representatives from several state agencies. The council is responsible for assessment and public reporting of

drought monitoring and water supply conditions, advising the governor on drought conditions, and ensuring effective coordination among agencies. The DCP is currently promoting outreach to inform entities of the assistance they can provide and looking for input as to how they can be more useful. Region L suggests that entities take advantage of the resources available to them through the DCP such as the Drought Annex which describes the activities that help minimize potential impacts of drought and outlines an effective mechanism for proactive monitoring and assessment and was published in 2014. More information on the DCP can be found on the Texas Department of Public Safety website

(http://www.txdps.state.tx.us/dem/CouncilsCommittees/droughtCouncil/stateDroughtPrep Council.htm).

Chapter 8

Α.

.

8 Policy Recommendations & Unique Sites [31 TAC §357.43]

8.1 Agricultural Water

8.1.1 Irrigation Water Needs

The South Central Texas Regional Water Planning Group (SCTRWPG) finds that, under current conditions and regional water planning guidelines, it is not practical for the SCTRWPG to develop water management strategies (WMS) designed to develop new water supplies or infrastructure for agricultural water users for projected irrigation water shortages. The complexity of the factors that influence decisions regarding the development of agricultural water supplies (e.g., commodity prices, variability of quality and quantity of local, privately-owned water resources, broad geographic distribution of needs, and other economic considerations of individual agricultural producers) substantially limits the SCTRWPG's ability to conceive of and evaluate discrete strategies to supply water for future water needs in many cases. See Appendix F for a summary of the unmet needs and a quantitative description of the socioeconomic impacts of not meeting these needs.

The SCTRWPG recommends that the Texas Water Development Board (TWDB), in cooperation with the agriculture industry agencies and trade groups in Texas, undertake studies of the factors that influence decisions regarding development of irrigation water supplies for the purpose of developing the best approach to: 1) project future irrigation water needs, and 2) identify the instances in which regional water planning efforts would be the most appropriate mechanism for developing strategies to meet future needs.

8.1.2 Agricultural Water Conservation Programs

The SCTRWPG recommends adequately funding the agricultural water conservation programs provided by the TWDB.

8.1.3 Water Use Information

The SCTRWPG recommends that TWDB develop the necessary programs and processes to accurately estimate annual water use for irrigation, including water use associated with agricultural activities unrelated to federal or state funding programs, and livestock watering categories.

8.2 Transport of Water

8.2.1 Water Transport Proposals

Given the number of proposals to transport large amounts of water within the areas represented by the SCTRWPG and surrounding regional water planning groups, the legislature should review the Texas Water Code to determine what, if any, changes should be made to address regional and interregional conflicts. Any changes to the

Code should include a provision for state funding to TWDB to support comprehensive technical studies to ensure that interested entities have the scientific data required to analyze and respond to such proposals. The technical studies and scientific data are essential to fully evaluate the effects of the proposals on the local communities, the environment, property owners, and the economy.

8.2.2 Collaboration Between Regional Planning Areas

The SCTRWPG recommends that the Legislature clarify that the boundaries of the regional water planning regions were drawn primarily to define water planning regions and were not intended as barriers to prevent water transport from one region to another or to favor one region over another for any reason.

8.3 Groundwater

8.3.1 Groundwater Management

The SCTRWPG respects the rules and regulations of groundwater conservation districts, as it does those of all other subdivisions of the state and state agencies. The SCTRWPG respects the decision of the Texas Supreme Court that groundwater is a private property right (Chapter 36 TWC). The SCTRWPG believes that all rules should be adopted pursuant to accepted administrative procedures based on the standards of rationality, equity, and scientific evidence. The SCTRWPG supports the determinations of Modeled Available Groundwater (MAG) based on Desired Future Conditions (DFC) established by Groundwater Management Area (GMA) pursuant to Chapter 36 of the Texas Water Code. The SCTRWPG supports the use of aquifer monitoring programs developed by groundwater conservation districts within a GMA to evaluate achievement of and compliance with DFCs.

Recognizing the management challenges facing groundwater conservation districts with multiple recommended water management strategies potentially seeking permits to withdraw groundwater supplies in excess of amounts determined to be available, the SCTRWPG approved the following series of recommendations applicable at appropriate locations in the 2016 Regional Water Plan.

Recommendation #1: When allocated groundwater exceeds the MAG in any decade, the Workgroup recommends that exempt use be maintained at the full estimated amount, while the permitted and grandfathered use amounts are reduced proportionately for planning purposes so that the total firm supply equals the MAG.

Recommendation #2: Where potentially feasible WMSs are contemplated that require new permits and allocated groundwater exceeds the MAG, show a firm supply of zero in the plan for the WMSs for planning purposes, but explain that groundwater for the WMSs may be obtained under existing permits through the Carrizo/Wilcox Transfers WMS or under new permits issued in accordance with GCD rules.

Recommendation #3: Where potentially feasible WMSs are contemplated that require new permits and allocated groundwater is less than the MAG, but allocated groundwater plus WMSs exceeds the MAG, show firm supplies of no more than the difference between allocated groundwater and the MAG in the plan for planning purposes, but explain that supplemental groundwater for the WMSs may be obtained under existing permits through the Carrizo/Wilcox Transfers WMS or under new permits issued in accordance with GCD rules.

Recommendation #4: For potentially feasible WMSs with firm supplies proportionately reduced or shown as zero for MAG compliance, evaluate facilities and costs for WMSs at both the reduced firm supply value associated with MAG compliance without transfers and at the supply amount that the sponsor seeks to develop.

Recommendation #5: For existing groundwater supplies that are fully permitted, or grandfathered, by a GCD and are proportionately reduced in quantity for planning purposes in this Plan for MAG compliance, include the following explanatory note in the regional water plan document and database at appropriate locations:

"For each aquifer in the region, the GCDs have adopted desired future conditions (DFCs). In some GCDs, full use of all groundwater supplies (permitted, grandfathered and exempt) may result in non-achievement of the DFCs for an aquifer. To ensure consistency with the DFCs, TWDB currently requires that groundwater availability for each aquifer be limited for planning purposes to the modeled available groundwater (MAG) for the aquifer. This has resulted, for planning purposes only, in adjustments to supply amounts in this plan for some areas for certain time periods. This should not be construed as recommending or requiring that GCDs make these adjustments. SCTRWPG recognizes and supports the ability of permit holders to exercise their rights to groundwater use in accordance with their permits and it recognizes and supports the GCDs' discretion to issue permits and grandfather historical users for amounts in excess of the MAG. SCTRWPG may not modify groundwater permits that GCDs have already issued or limit future permits that GCDs may issue. If the MAG is increased during or after this planning cycle, SCTRWPG may amend this Plan to adjust groundwater supply numbers that are affected by the new MAG amount."

Recommendation #6: For potentially feasible WMSs that have GCD permits for a portion of the needed supply and the remainder is not yet permitted, include the following explanatory note in the regional water plan document and database at appropriate locations:

"For each aquifer in the region, the GCDs have adopted desired future conditions (DFCs). In some GCDs, full use of all groundwater supplies (permitted, grandfathered and exempt) may result in non-achievement of the DFCs for an aquifer. To ensure consistency with the DFCs, TWDB currently requires that groundwater availability for each aquifer be limited for planning purposes to the modeled available groundwater (MAG) for the aquifer. This has resulted, for planning purposes only, in adjustments to permit amounts, and a lack of firm water available for future permits in this plan for some areas for certain time periods. This should not be construed as recommending or requiring that GCDs make these adjustments, or deny future permit applications. SCTRWPG recognizes and supports the ability of permit holders to exercise their rights to groundwater use in accordance with their permits and it recognizes and supports the ADFCs and grandfather historical users for amounts in excess of the MAG. SCTRWPG may not modify groundwater permits that

GCDs have already issued or limit future permits that GCDs may issue. If the MAG is increased during or after this planning cycle, SCTRWPG may amend this Plan to adjust groundwater supply numbers that are affected by the new MAG amount."

8.3.2 Groundwater Sustainability

The SCTRWPG recommends the management of groundwater resources toward the goal of long-term sustainability and recommends WMS that support achievement of this goal. This recommendation is intended to help protect all users of aquifers, to help preserve the long-term integrity of aquifers, and to build awareness of the effects of groundwater production and development on those aquifers. The SCTRWPG recommends that anyone implementing any WMS within this regional water plan relying on groundwater resources incorporate groundwater monitoring of both quantity and quality, recharge protection and enhancement, conservation methods and related practices, as determined to be appropriate by local groundwater districts. Where no district exists, the developer should monitor impacts and, when appropriate, take corrective action consistent with the goal of groundwater sustainability. The SCTRWPG recommends that the Texas Legislature and/or TCEQ develop a process requiring certified letters be sent to the Commissioners Court in the county/counties where the well field is located clearly describing the project.

8.3.3 Shared Groundwater Resources among Planning Regions

In the event a Water User Group relies on a groundwater management strategy to meet the Water User Group's demand during the planning period and the strategy would have a significant impact on a groundwater resource shared among planning region(s), notice should be provided to the region(s) of the proposed date of implementation and anticipated acre-feet per year demand on the shared groundwater resource. The SCTRWPG provided such notice to the Lower Colorado (K) and Brazos G planning regions with regard to the Hays County – Forestar Project and the Vista Ridge Project (SAWS) recommended to meet projected needs in the 2016 South Central Texas Regional Water Plan.

8.3.4 Reliance on Groundwater and Surface Water for Future Needs

The SCTRWPG recognizes a need to rely on both groundwater and surface water resources to develop a practical and reasonable plan to address water needs within the region for the future. The SCTRWPG recommends that the state provide incentives to develop conjunctive use projects that more efficiently utilize groundwater and surface water.

8.3.5 Land Stewardship

The SCTRWPG encourages State support of implementing or enhancing land stewardship management practices that are shown to augment the quality and quantity of the state-owned surface water and privately-owned groundwater resources.

8.3.6 Development and Use of Groundwater

The SCTRWPG encourages legislation that promotes public or private entities planning to develop groundwater projects to provide an economic analysis of the impact to communities, instream flows, and bay and estuary systems incurred by movement of the groundwater.

8.3.7 Coordination of Regional Water Planning and Groundwater Management Area Processes

The SCTRWPG recognizes that having the most current information on available groundwater supplies is critical to the planning process. The 83rd Texas Legislature, through SB1282, extended the deadline for GMAs to submit DFCs to May 1, 2016. This has created a compressed schedule that may impact the 2021 regional water plans. For example, if the Technical Memorandum for the 2021 Region L Plan is due to the TWDB by February 2018 and MAGs are released up to 24 months after the DFCs are submitted, then the new MAGs based upon May 2016 DFCs would be available three months after the due date of the Technical Memorandum for the 2021 Region L Plan. Thus, the Technical Memorandum for the 2021 Region L Plan could have to be prepared using the current MAGs based upon the DFCs established in 2010. It is the recommendation of the SCTRWPG that the TWDB release MAGs within 14 months of DFC submittal in May 2016.

8.4 Surface Water

8.4.1 Surface Water Rights Monitoring and Administration

The Texas Commission on Environmental Quality (TCEQ) should be adequately staffed and funded to ensure the legal and appropriate use of permitted surface water rights through comprehensive monitoring and administrative programs, such as the Watermaster program. Such monitoring and administrative programs should address surface water / groundwater interactions in cooperation with appropriate groundwater conservation districts and the administration of downstream water rights. The SCTRWPG reaffirms its commitment to safeguarding the integrity of downstream water rights.

8.4.2 Reliance on Groundwater and Surface Water for Future Needs

The SCTRWPG recognizes a need to rely on both groundwater and surface water resources to develop a practical and reasonable plan to address water needs within the region for the future. The SCTRWPG recommends that the state provide incentives to develop conjunctive use projects that more efficiently utilize groundwater and surface water.

8.4.3 Surface Water Availability Model (WAM) Updates

The SCTRWPG recommends that the Guadalupe – San Antonio River Basin Water Availability Model (GSA WAM) be updated using available hydrologic data for at least the 1990-2013 historical period and that funding sufficient to accomplish this task be

allocated to the TCEQ. Although a new drought of record has not occurred since the 1950s, the recommended update would increase the simulation period by 43 percent and facilitate development of improved estimates of channel losses and missing streamflow records (esp. those during the drought of record) throughout the watersheds. Periodic updates to this model should be performed at intervals so that hydrologic data in the models includes data to within five years of the current date.

8.5 Conservation

8.5.1 Conservation Planning Guidelines

The Because of the central role of conservation in achieving the water supply objectives of the South Central Texas Regional Water Plan, the SCTRWPG has previously adopted the Water Conservation Implementation Task Force recommendations to establish GPCD Targets and Goals related to average annual reductions in residential indoor use. The SCTRWPG recognizes that the creation of conservation programs and the selection of specific conservation technologies is a matter of local choice and recommends that the water user groups reference the Water Conservation Best Management Practices Guide, TWDB Report 362, as an educational tool that can facilitate understanding of the importance of conservation efforts and the wide range of methods available for use.

Region L has addressed, defined, and adopted the most reasonably practical level of conservation to be:

- 1. For Water Use Groups (WUGS) with per capita water use of 140 gallons per capita per day (gpcd) and greater in year 2011, reduce gpcd by 1 percent per year until reaching 140 gpcd, and reduce gpcd by 0.25 percent per year thereafter.
- 2. For WUGS with per capita water use less than 140 gpcd in year 2011, reduce gpcd by 0.25 percent per year.

8.5.2 Implementation of Water Conservation Advisory Committee Recommendations

SCTRWPG recognizes and supports recent legislative focus on successfully passing legislation which promotes implementation of broad-based conservation measures throughout the state. The SCTRWPG supports legislation and funding to implement the HB 4 (2007) Water Conservation Advisory Committee's recommendations, particularly the statewide public education programs such as Water IQ, further definition of gpcd definitions, and the development of regional conservation data that can be used by the SCTRWPG members to optimize future conservation efforts. The SCTRWPG also supports further efforts by the Legislature and state agencies that aggressively promote practical and successful water conservation measures as an important component to future water plans.

8.6 Innovative Strategies

8.6.1 Assistance for Alternative Water Supply Strategies

The State should increase funding to assist water planning regions and local water entities in developing demonstration projects for alternative water supply strategies and technologies, such as, but not limited to, desalination, and direct potable reuse. By funding demonstration projects for alternative technologies, the State can help local water management entities avoid adverse impacts to the environment, to property rights, and to local socio-economic conditions. In this way, the State can play a crucial role in guiding regions to water supply solutions that meet needs. Funding to demonstrate the feasibility and value of innovative long-term strategies can help achieve cost-saving, efficient regional and local water management solutions.

8.6.2 Brackish Groundwater and Seawater Desalination

The SCTRWPG supports the funding of state and/or federal programs for research and potential incentives to make desalination more affordable. Should financial incentives, technical advances, and/or other factors make a seawater desalination strategy similar to that described in Chapter 5 sufficiently attractive to a water user group or WWP that implementation prior to year specified herein is desired, it is explicitly recognized by the SCTRWPG that such rescheduled implementation is consistent with the 2016 South Central Texas Regional Water Plan.

8.6.3 Codification of Seawater Desalination

The SCTRWPG recognizes the importance of seawater desalination as a source of new, drought-proof, water supply that can be integrated with other regional water supply strategies. The SCTRWPG encourages the Legislature to amend the Water Code to add a new Chapter to include seawater in the State's administration of water rights and supply.

8.6.4 Assistance for Alternative Rangeland Management (Brush Management)

The SCTRWPG encourages the Legislature to increase funding to the Texas State Soil and Water Conservation Board for the purpose of studying the effectiveness of brush control programs integrated with proven rangeland management practices.

8.6.5 Rainwater Harvesting and Other Systems

The SCTRWPG encourages the study of the effectiveness of rainwater harvesting systems in both commercial and residential new development. The SCTRWPG recommends the TWDB develop programs to educate the public and building industry on the potential benefits of rainwater harvesting, water re-use, and gray water systems.

8.6.6 Weather Modification

The SCTRWPG urges the state to continue to support the existing Weather Modification Program.

8.6.7 Drought Management

The SCTRWPG has applied the TWDB's Costing Tool for Regional Water Planning including the general methodology for estimating the economic impacts associated with implementation of drought management as a water management strategy. Application of this methodology for regional water planning purposes has facilitated comparison of drought management to other potentially feasible water management strategies on a unit cost basis. The SCTRWPG has found, and the San Antonio Water System (SAWS) has demonstrated, that water user groups having sufficient flexibility to focus on discretionary outdoor water use first and avoid water use reductions in the commercial and manufacturing use sectors may find some degrees of drought management strategies. Recognizing that implementation of appropriate water management strategies is a matter of local choice, the SCTRWPG recommends due consideration of economically viable drought management as an interim strategy to meet near-term needs through demand reduction until such time as economically viable long-term water supplies can be developed.

8.6.8 Aquifer Storage and Recovery

The SCTRWPG urges the state to continue to support existing and development of new Aquifer Storage and Recovery (ASR) facilities to supplement water supplies during extended drought and seasonal peaking conditions.

The SCTRWPG recognizes the value of ASR facilities as an effective way to store large volumes of water while avoiding evaporative losses experienced with reservoirs. The application and effectiveness of ASR varies with the geological formation of an aquifer. To date the application of ASR in Region L has been in the storage of groundwater from one aquifer in another aquifer where water quality between the water injected and stored and the natural occurring groundwater supply are similar or could mix without risk to the water quality of both sources. One advantage of this innovative ASR storage option could be to divert and store surface water flows that occur during floods and make the stored water available to meet established environmental flow standards during drought; however, the surface water injected would need to be treated to such a quality as to not cause water quality concerns in the receiving aquifer and be suitable for its ultimate use upon recovery. The SCTRWPG recommends that the TWDB and the TCEQ support the implementation of ASR storage for surface water supplies as an alternative to reservoirs and for support of environmental flows.

8.6.9 Water Reuse

The SCTRWPG recognizes the potential offered by the reuse of treated municipal wastewater, agricultural return flows, and industrial process water to augment water supply. The SCTRWPG has approved multiple water management strategies that enable utilities and industries to extend use of their existing water resources through

treatment and reuse of water. The SCTRWPG recommends that the State, through the TWDB and TCEQ: 1) financially support research for determining appropriate technology and risk mitigation approaches necessary to significantly expand water reuse with appropriate protections for public, environmental, and worker health; and 2) assist the funding and development of incentive programs to advance water reuse projects. The SCTRWPG encourages the Legislature to amend the Water Code to add a new chapter to include reuse in the State's administration of water rights.

8.7 Environmental

8.7.1 Protection of Edwards Aquifer Springflow

The SCTRWPG supports implementation of the Edwards Aquifer Habitat Conservation Plan (EAHCP) as approved by the United States Fish & Wildlife Service (USFWS), resulting in the issuance of an Incidental Take Permit. The SCTRWPG recognizes that the EAHCP was developed to "protect the federally-listed species potentially affected by the management and use of the Aquifer and certain other activities in the Comal and San Marcos ecosystems (EAHCP Sec. 1.2.1)." Recognizing that implementation of the EAHCP is an ongoing, phased process, the SCTRWPG approved the following recommendations during its meeting of March 14, 2013:

"The Edwards Aquifer Habitat Conservation Plan (EAHCP) Workgroup recommends that the South Central Texas Regional Water Planning Group include the EAHCP as a recommended Water Management Strategy in the 2016 South Central Texas Regional Water Plan and use the spring flows associated with EAHCP implementation as an hydrologic modeling assumption for computation of existing surface water supplies and technical evaluation of water management strategies. The EAHCP Workgroup further recommends that existing water supplies from the Edwards Aquifer in the 2016 South Central Texas Regional Water Plan be those associated with EAHCP implementation and in specific amounts to be determined in consultation with the Edwards Aquifer Authority."

8.7.2 Ecosystem Health, Quality of Life, and Growth Management for Texas

The rapid growth occurring in South Central Texas has the potential to negatively impact quality of life. Human demands for water and infrastructure development may outstrip the ability of all of the region's resources to respond and to be sustainable. Texas should focus on these issues and evaluate land use and the health of its ecosystem in order to prepare for the future and support a sustainable quality of life for all Texans.

8.7.3 Ecologically Unique Stream Segments and Unique Reservoir Sites

Designation of Five Unique Stream Segments

The Legislature has clarified that the designation of a stream segment as having unique ecological value "solely means that a state agency or political subdivision of the state

may not finance the actual construction of a reservoir in a specific river or stream segment designated by the legislature." The SCTRWPG conditionally recommends to the Texas Legislature that, in accordance with Subsection 16.051 of the Texas Water Code, it designate the following five stream segments in Region L as having unique ecological value:

- The Nueces River from the northern boundary of Region L downstream to United States Geological Survey (USGS) gauge # 08190000 at Laguna;
- The Frio River from the northern boundary of Region L downstream to USGS gauge #08195000 at Concan;
- The Sabinal River from the northern boundary of Region L downstream to the State Highway 187 crossing located approximately 2.7 miles upstream of USGS gauge #08198000 near Sabinal;
- The San Marcos River extending from IH 35 up to a point 0.4 miles upstream of Loop 82 in San Marcos; and
- The Comal River extending from the confluence with the Guadalupe River upstream to Klingemann Street in New Braunfels.

Because the consequences of such designations by the Legislature are not well understood, these recommendations are conditioned upon legislation providing for these designations containing the following clarifying provisions or substantially similar provisions approved by Region L:

The designation of a river or stream segment as being of unique ecological value:

- Does not affect the ability of a state agency or political subdivision of the state to finance, construct, operate, maintain, or replace a weir, a water diversion, flood control, drainage, or water supply system, a low water crossing or a recreational facility in the designated segment;
- Does not prohibit the permitting, financing, construction, operation, maintenance, or replacement of any water management strategy to meet projected water supply needs recommended in, or designated as an alternative in, either the 2011 or 2016 regional water plans for Region L; and
- Does not alter any existing property right of an affected landowner.

The SCTRWPG Recommendation of Stream Segments Having Unique Ecological Value for Legislative Designation is included as Appendix H, along with a letter from Texas Parks & Wildlife Department summarizing their review of the recommendation package.

Recognition of Potential Additional Stream Segments of Unique Ecological Value

The SCTRWPG believes that designating ecologically unique stream segments raises public awareness and voluntary stewardship that can result in the preservation of the character and environmental function of these segments. The SCTRWPG recognizes the ecologically significant stream segments designated by Texas Parks and Wildlife Department in July 2005 (See Chapter 6). The SCTRWPG shall consider these stream segments as a guide for recommending additional Stream Segments of Unique Ecological Value for future legislative designation. The SCTRWPG recommends increased TWDB funding to be allocated for future planning cycles to conduct analyses necessary for designation of additional stream segments.

8.7.4 Instream Flows and Bays and Estuaries

The SCTRWPG is appreciative of legislative action in the form of Senate Bill 3 (SB3, 80th Texas Legislature) that established and funded an environmental flows process integrating best-available science and diverse regional stakeholder input into the process for selection of appropriate instream flow and freshwater inflow goals on a stream-by-stream and estuary-by-estuary basis. The appropriate balance of environmental and human needs during severe drought has very significant effects on the firm yield and associated cost of potential water supply projects. The 2016 regional water plans are the first to be prepared using environmental flow standards adopted pursuant to the SB3 process.

The SCTRWPG encourages completion of the Texas Instream Flow Studies Program and improvement of the State's bays and estuaries freshwater inflow studies, with special attention paid to the report of the Science Advisory Committee of the Study Commission on Water for Environmental Flows.

8.7.5 Environmental Studies

The SCTRWPG recognizes that significant needs exist in Bexar and the surrounding counties and that new supplies need to be developed in the Guadalupe River and San Antonio River watersheds. There are issues related to environmental impacts that need further study to determine feasibility of a range of recommended surface water, groundwater, reuse, and conjunctive use water management strategies. Therefore, the SCTRWPG recommends that additional environmental studies be undertaken to be able to evaluate the effects of such projects on the ecosystems that rely on inflow to San Antonio Bay and flows of the Guadalupe River and San Antonio River watersheds.

8.7.6 Water Quality

The primary focus of the Regional Water Planning process is to ensure that water supplies are identified in sufficient quantity to meet future water demands; however, the SCTRWPG also recognizes that the quality of those water supplies is also important to protect. Protecting groundwater and surface water supplies from contamination not only helps to reduce the cost to treat water to public drinking water standards, but also reduces pollutants that may harm the ecological health of the basin. The SCTRWPG recommends that the TCEQ and local governments promote practices and/or regulations to avoid or mitigate threats to water quality in surface water and groundwater sources.

8.8 Providing and Financing Water and Wastewater Systems

8.8.1 Plan Implementation

Given the unprecedented level of time and money expended in the development of Regional Water Plans across the state, the SCTRWPG urges the Legislature to act promptly to help ensure full implementation of these plans.

8.8.2 Funding

The SCTRWPG believes that State funding should be provided as a key incentive for partnership in funding from local, regional and federal governmental agencies.

The SCTRWPG encourages more active State support in solicitation of Federal funding for development of new water supply sources, especially when the need for which is based in part upon Federal requirements, such as the Endangered Species Act.

8.8.3 State Water Implementation Fund for Texas

In 2013, the Texas Legislature authorized transferring \$2 billion from the state's "Rainy Day Fund" to create a new loan program to fund projects in the state water plan and make financing water projects more affordable. The creation of the State Water Implementation Fund for Texas (SWIFT), as this program has become known, was approved by Texas voters in November 2013. According to the TWDB website, the SWIFT is estimated to fund approximately \$27 billion in water supply projects over the next 50 years. The program will apply not less than 20 percent of SWIFT financial assistance for water conservation and reuse projects and an additional 10 percent will be for projects serving rural areas, including agricultural conservation projects. Since its approval, the TWDB has worked with the regional water planning groups to develop criteria to prioritize projects to be eligible to receive the SWIFT loans. The TWDB began accepting applications in late 2014 with the first loan closings to occur in late 2015.

The SCTRWPG supports the SWIFT as a reliable financing source for project sponsors to fund projects and will be monitoring its first implementation cycle. Based upon the results of this initial process, the SCTRWPG reserves the right to offer suggestions to the TWDB aimed at maximizing the program's future effectiveness.

8.8.4 State Water Plan Implementation

State support is fundamental for the successful implementation of the water resources projects in the State Water Plan resulting from the SB1 Regional Planning Process. Specifically, State support for implementation of the State Plan should include sufficient funding for TWDB and TCEQ to administer their programs and activities associated with planning, financing, and permitting of the projects in the State Plan.

8.8.5 Continuation of Regional Water Planning

The SB1 Planning Process is an important program, and funding should be continued to sustain the work of the Regional Water Planning Groups.

8.8.6 2021 Plan Enhancement Process

In response to comments raised by members of the SCTRWPG and the public during the review of the Initially Prepared 2016 Regional Water Plan, the SCTRWPG has categorized strategic topic areas for discussion that will enable the group to improve its development of the 2021 Regional Water Plan. The process will be referenced as the 2021 Plan Enhancement Process. The topic areas to be discussed are listed in the September 3, 2015 report from the Public Comment and Plan Assessment Workgroup included as Appendix M. The 2021 Plan Enhancement Process will begin at the SCTRWPG's first meeting in 2016. Topics will be discussed as a group and actions will be taken, as needed, to document the direction and/or policy consensus reached by the SCTRWPG. The results from the 2021 Plan Enhancement Process will be used to guide the development of the next plan within the framework of state statute, TWDB rules, and state/local funding.

8.8.7 Role of the TWDB

The SCTRWPG supports the concept that a state agency (TWDB) be responsible for implementation of and advocacy for projects in the State Water Plan with regard to funding and permitting at the state and federal levels.

8.9 Data

8.9.1 Water Data Collection

The Legislature should fully fund the cooperative, federal-state-local program of basic water data collection, including: (a) Stream gages-quantity and quality; (b) Groundwater monitoring-water levels and quality; (c) Hydrographic surveys and sediment accumulation in reservoirs; (d) Water surface evaporation rates; (e) Water use data for all water user groups; and (f) Population projections.

8.9.2 Access to State Water Data

There should be adequate funding for the critical roles of TWDB and TCEQ in facilitating access to water data essential for local and regional planning and plan implementation purposes.

8.9.3 Population and Water Demand Projections

The SCTRWPG recognizes that the TWDB bases its water demand projections on patterns of population and economic growth while also permitting revisions of state data to incorporate additional information developed by the planning regions. The SCTRWPG appreciates that the TWDB has facilitated more active involvement of the Regional Water Planning Groups in refining water demand projections for use in the 2016 regional water plans. Nevertheless, some groups believe that the methodology puts an unfair limitation on access to water for future growth, particularly in areas that may experience more rapid change than they have in the past. The SCTRWPG has struggled with the lack of flexibility within the methodology to address rapidly growing municipal water demands associated with the transient work forces and long-term operations and maintenance

personnel supporting extraction, collection, and transport of oil and gas resources found in the Eagle Ford shale. In circumstances such as this, the SCTRWPG encourages greater TWDB flexibility through relaxation of current methodological assumptions holding regional and state population projection totals fixed. Water demand projections used in developing the Regional Water Plan should be consensus figures arrived at by using TWDB data along with local input from the cities, counties, and groundwater districts.

8.10 Other Issues

8.10.1 Water Management Strategies

Inclusion of a WMS in this plan, as either a recommended or alternative WMS, is not an endorsement by this planning group of that WMS for permitting, financing, or for any reason other than as a water supply that has met TWDB standards for being considered as a potential water supply for regional planning purposes.

8.10.2 Planning for System Management Water Supplies

System management water supplies, i.e. supplies over and above those apparently needed to meet projected demands, may be included in the plan for the following reasons: 1) to recognize both the long lead times and the uncertainty associated with risk factors that may prevent implementation of water management strategies and necessitate replacement strategies; 2) to preserve flexibility for water user groups or wholesale water suppliers to select the most feasible projects among several consistent with the Regional Plan and therefore potentially eligible for permitting and funding; 3) to serve as additional supplies in the event rules, regulations, or other restrictions limit use of any planned strategies; and 4) to ensure adequate supplies in the event of a drought more severe than that which occurred historically. The plan should specify those factors affecting reliability of the recommended options and strategies and indicate what alternatives are available as possible replacements.

The amount of the management supply should be limited by consideration of the following factors: 1) potential disruptive impacts of planning for projects that have low probability of implementation; and 2) citing of specific reasons for management supplies that exceed the projected needs of the region.

8.10.3 Public Education on Water

The State should fund a state-wide program to educate the general public about water in coordination with the Agricultural Extension Service offices. The program should produce water-related materials with special components adapted for each water planning region and should also include a component comparable to the "Major Rivers" program that would be available to the public schools through the Regional Education Service Centers and by other means.

SCTRWPG supports legislation for funding to implement the Water Conservation Task Force recommendations, particularly the statewide public education programs, such as Water IQ.

8.10.4 County Authority

Counties should have additional authority for land use planning and for regulating development based on water availability and protection of water resources.

8.10.5 Planning Requirements

There should be no changes in the regional water planning process or additional planning requirements, except through the formal rule-making procedure. Contract requirements should be established and in place prior to submission of grant proposals.

8.10.6 Condemnation and Eminent Domain

The SCTRWPG is of the opinion that it is not appropriate for a regional water planning group to tell a governmental entity to abandon its eminent domain powers if it wants its project to be approved as a recommended water management strategy. The SCTRWPG is further of the opinion that it is not within the planning group's jurisdiction to judge the merits of eminent domain. It is, however, the preference of the SCTRWPG that all land needed for implementation of water management strategies be obtained using a process of willing seller and willing buyer and that limited condemnation be used as a last resort.

2016 South Central Texas Regional Water Plan Volume I

Chapter 9

Water Infrastructure Funding Recommendations

9.1 Introduction

9

Senate Bill 2 (77th Texas Legislature) requires that an Infrastructure Financing Report (IFR) be incorporated into the regional water planning process. In order to meet this requirement, each Regional Water Planning Group (RWPG) is required to examine the funding needed to implement the water management strategies and projects identified and recommended in the region's 2016 Regional Water Plan.

9.2 Objectives of the Infrastructure Financing Report

The primary objective of the Infrastructure Financing Report is to determine the financing options proposed by political subdivisions to meet future water infrastructure needs (including the identification of any State funding sources considered).

9.3 Methods and Procedures

For the South Central Texas Regional Water Planning Area, all municipal water user groups and wholesale water providers having water needs and recommended water management strategies in the Regional Water Plan with an associated capital cost were surveyed using the questionnaire provided by the TWDB. Individual municipalities and wholesale water providers were emailed a survey to complete, scan, and return to the San Antonio River Authority and/or HDR.

For each project with an identified capital cost, the survey respondents were asked to enter only the amounts that they wish to receive from one or more of the TWDB programs listed below and the year in which the funds are needed:

- Planning, Design, Permitting, and Acquisition: Costs were entered into this category if the entity wants to participate in TWDB programs offering subsidized interest and deferral of principal and interest for planning, design, acquisition, and permitting costs.
- Construction Funding: Costs were entered into this category if the entity wants to obtain subsidized interest for all construction costs, including planning, design, and construction.

In addition, entities were asked the amount of state participation anticipated with each project.

2016 South Central Texas Regional Water Plan Volume I

9.4 Survey Responses

The South Central Texas RWPG sent survey forms to 36 municipal water user groups and wholesale water providers, one irrigation water user group, and one mining water user group. The RWPG received eight responses, a 22 percent response rate (Table 9-1). The eight responses represent about 95 percent of the estimated capital costs of water management strategies included in the Regional Water Plan. Of those responding, for which the total capital cost for facilities is \$7,436,737,000, the survey shows that approximately \$7,083,785,000 (95.3 percent of the total capital costs) would be sought through the state participation programs. It is unclear how the remaining 4.7 percent of capital costs for survey respondents would be paid, but those costs might be covered through local cash reserves, bonds, or private funding. Furthermore, it is unclear how the remaining 5.5 percent of the capital costs for those entities not responding to the survey would be financed.

10 Regional Water Plan Adoption [31 TAC §357.21 and §357.50]

Key activities defining the contents of the 2016 South Central Texas Regional Water Plan (2016 SCTRWP) and leading to its timely adoption include the performance of workgroups addressing challenging issues, coordination with water user groups and wholesale water providers, coordination with other planning regions, and active public participation throughout the planning process. These key activities are described in Chapters 10.1 through 10.4. Upon adoption and distribution of the Initially Prepared Plan (IPP), public hearings were held and comments received. Public hearings, comments received, and responses to these comments are summarized in Chapters 10.5 and 10.6. Final adoption of the 2016 SCTRWP is documented in Chapter 10.7.

10.1 Workgroups

Numerous complex and/or contentious issues arose in the process of developing the 2016 SCTRWP. As in previous planning cycles, the South Central Texas Regional Water Planning Group (SCTRWPG) found it advantageous to form workgroups focused on such issues. Each workgroup was charged to explore its issue(s) and develop consensus recommendations for resolution of the issue(s) for SCTRWPG consideration and potential action. Results obtained by each workgroup are reflected in the minutes of the SCTRWPG meetings and throughout the 2016 SCTRWP. Support for these workgroups was provided by the technical and public participation consultants, the plan administrator (San Antonio River Authority), water suppliers, state agencies, groundwater conservation districts, contracted researchers, and other stakeholders. The nine (9) workgroups assembled for the 2016 Plan are listed, in alphabetical order, below along with their respective workgroup and/or relevant technical consultant meeting date(s).

- Carrizo Aquifer April 15, 2013; May 22, 2013; November 6, 2013
- Eagle Ford Shale March 27, 2013; April 25, 2013; May 1, 2013; May 23, 2013
- Edwards Aquifer Habitat Conservation Plan (EAHCP) February 21, 2013; March 11, 2013; April 29, 2013; June 25, 2013; a report was provided by the EAHCP Program Manager at each SCTRWPG meeting
- GBRA Lower Basin Storage Project Questions (aka Reuse) September 4, 2014; November 10, 2014; February 5, 2015
- Non-Municipal Water Demand Projections February 23, 2012
- Policy Recommendations December 19, 2014; February 17, 2015
- Public Comment and Plan Assessment August 19, 2015
- Unique Stream Segments January 21, 2015
- Water Management Strategy Prioritization February 20, 2014; March 21, 2014

In addition, the Staff Workgroup, comprised of the SCTRWPG Executive Committee and representatives of the plan administrator, Texas Water Development Board (TWDB),

water suppliers, and the technical and public participation consultants, convened two weeks in advance of each SCTRWPG meeting. The Staff Workgroup provided a preliminary review of materials prepared by the technical and public participation consultants, refined SCTRWPG meeting agendas, and prepared administrative matters for SCTRWPG consideration and action.

10.2 Coordination with Water User Groups and Wholesale Water Providers

The technical consultant met and/or corresponded with representatives of all wholesale water providers and many water user groups throughout the development of the 2016 SCTRWP. The following is a summary of meeting dates with wholesale water providers:

- Canyon Regional Water Authority April 17, 2013; August 13, 2013; September 30, 2014
- Cibolo Valley Local Government Corporation April 16, 2013; October 23, 2013; October 6, 2014
- Guadalupe-Blanco River Authority April 22, 2013; October 7, 2014; October 14, 2014
- Hays Caldwell Public Utility Agency April 26, 2013; September 30, 2014; October 14, 2014
- San Antonio Water System April 15, 2013; September 29, 2014
- Schertz Seguin Local Government Corporation April 16, 2013; October 23, 2013; October 6, 2014
- Springs Hill Water Supply Corporation April 8, 2013; October 23, 2013
- Texas Water Alliance April 17, 2013; October 23, 2013; October 14, 2014

These meetings generally focused on accurate portrayal of existing water supplies and contractual commitments, projected water demands, and potentially feasible water management strategies preferred by the wholesale water provider or water user group to meet future needs. In addition to meetings and telephone correspondence, all wholesale water providers and water user groups were afforded opportunities to provide information regarding existing supplies, projected demands, and preferred water management strategies through on-line surveys.

10.3 Coordination with Other Planning Regions

The South Central Texas Regional Water Planning Area (Region L) is surrounded by five adjacent planning areas, including: Plateau (J), Lower Colorado (K), Rio Grande (M), Coastal Bend (N), and Lavaca (P). In addition, the 2016 SCTRWP includes one recommended water management strategy (SAWS Vista Ridge Project) with source water drawn from the non-adjacent Brazos G Regional Water Planning Area. To the extent necessary, coordination with each of these regions was accomplished through chair correspondence, RWPG liaisons, and/or technical consultant collaboration. Subjects of coordination, correspondence, or collaboration included projected demands,

confirmation of water user group allocations among regions, and specific water management strategies of interest (e.g., SAWS Vista Ridge, Hays County Forestar, Hays County Pipeline, GBRA Lower Basin Storage, and Lavaca Off-Channel Reservoir). The SCTRWPG is aware of no interregional conflicts involving Region L recommended water management strategies.

10.4 Public Participation

Public participation was an important element in all phases of development of the 2016 SCTRWP. All SCTRWPG meetings were preceded by required notice and open to the public. Opportunities for public comment were available at the beginning and end of every SCTRWPG meeting and summaries of comments received are included in the approved minutes of each meeting. Communication of information was facilitated and supported by the Region L website (http://www.regionltexas.org/) maintained by the San Antonio River Authority (SARA) the TWDB website and Throughout the planning (http://www.twdb.texas.gov/waterplanning/rwp/index.asp). process, SCTRWPG members, SARA, and the technical and public participation consultants provided responses to inquiries from the public.

10.5 Public Hearings and RWPG Responses to Comments on Initially Prepared Plan

The Initially Prepared Plan (IPP) was adopted on April 2, 2015 and posted for review and comment on May 1, 2015. Hardcopies and electronic versions of the IPP were made available throughout the region and on the internet. Public hearings on the IPP were held in San Antonio (June 8, 2015), San Marcos (June 10, 2015), and Victoria (June 11, 2015). A cumulative total of 25 oral comments were received during these three public hearings with several individuals attending and providing oral comment at multiple hearings. Written public comments on the IPP were accepted through August 14, 2015.

A total of 386 comments on the IPP were received. The vast majority of these comments focus on the Cibolo Valley Local Government Corporation (CVLGC) Carrizo Project, with 189 in favor and 118 opposed. These and other comments and concerns are briefly summarized in a September 3, 2015 Report from the Public Comment and Plan Assessment Workgroup prepared by SCTRWPG Chair Con Mims and included herein as Appendix M. The September 3, 2015 report includes recommended responses to state agency, CVLGC Carrizo Project, and other comments; and these recommended responses were approved by consensus of the SCTRWPG during its September 3, 2015 meeting. Comments of the Texas Parks and Wildlife Department are included as Appendix N. Finally, a more detailed summary of public comments on the IPP was prepared by the public participation consultant and is included as Appendix O.

10.6 TWDB Comments on Initially Prepared Plan and RWPG Responses

The Texas Water Development Board (TWDB) provided written comments on the IPP which are included as Appendix P. Responses to these comments, as approved by consensus of the SCTRWPG during its September 3, 2015 meeting, are shown in bold italics in Appendix P and reflected in appropriate locations throughout the adopted 2016 SCTRWP.

10.7 Final Regional Water Plan Adoption

The 2016 SCTRWP was certified complete and adopted by a majority vote of the SCTRWPG on November 5, 2015 and submitted to the TWDB on December 1, 2015 for approval and integration into the 2017 State Water Plan.

11 Comparison to the Previous Regional Water Plan

11.1 Implementation of Previous Regional Water Plan

A survey was sent to Region L WUGs and WWPs regarding the status of recommended strategies presented in the 2011 SCTRWP. Three entities responded by April 22, 2015, representing seven WUGs/WWPs and 24 water management strategies. The survey included information regarding the project description and infrastructure type. The WUGs and WWPs were asked to update the regional planning group on the level of implementation currently achieved, the initial volume of water provided, the funds expended to date, project cost, funding source and year the project went online. If the project was a phased project, the WUGs were asked about the ultimate volume, project cost, and year that the project will reach maximum capacity. If the project was not implemented, the WUGs were asked to comment on why that was the case. The survey also had a column regarding inclusion in the 2016 plan for both phased and non-implemented projects. Results of the survey (as of April 22, 2015) are summarized in Table 11-1. The full list of projects, including responses gathered to date, can be found in Appendix K.

Responding Entity	WUG/WWP	Projects Implemented	Projects Under Construction	Projects in Design	Projects in Study
SAWS	SAWS	4	1	0	1
3AVV3	Bexar Met	1	0	0	0
Springs Hill WSC	Springs Hill WSC	1	0	0	0
	GOFORTH WSC	0	0	1	0
	KYLE	0	0	1	0
HCPUA	MOUNTAIN CITY	0	0	1	0
	SANTA CLARA	0	0	1	0

Table 11-1 Summary of Project Implementation

11.2 Comparison to Previous Regional Water Plan

With each regional water planning cycle, population and demand projections can potentially change for each Water User Group (WUG). Population changes due to updated information, either from the latest census or better estimates from the Texas State Demographer. Water demands change due to changes in population, variances in GPCD values which are affected by conservation efforts, drought measures, and a shifting water uses. New WUGs are introduced while other WUGs fall below the TWDB threshold to be a WUG and/or combine with other entities. This chapter compares the changes of projections in water demand, source water availability, the drought of record, existing supplies, needs, and water management strategies between this plan and the last regional plan. The 2011 Regional Water Plan covered the period fro 2010 to 2060, while the 2016 Regional Water Plan covers the period from 2020 to 2070.

Water Demand Projections

In general, water demand projections for the region are greater in the 2016 South Central Texas Regional Water Plan (SCTRWP). Municipal water demand projections are slightly higher in the 2016 SCTRWP than in the 2011 Plan for each decade, increasing to 754,306 acft/yr by the 2070 decade (Figure 11.2-1). Non-Municipal demands, however, remain about the same throughout the planning period (Figure 11.2-2). The 2011 SCTRWP has higher projections for 2020 through 2040, and the 2016 SCTRWP projections begin exceeding the 2011 Plan projections slightly in 2050 and 2060. The total water demands for all entities in the region were projected to increase from under 1,000,000 acft/yr in 2010 to 1,291,567 in 2060 for the 2011 Plan (Figure 11.2-3). The total water demand projections for the 2016 Plan increase from 1,070,354 acft/yr in 2020 to 1,433,835 acft/yr in 2070.

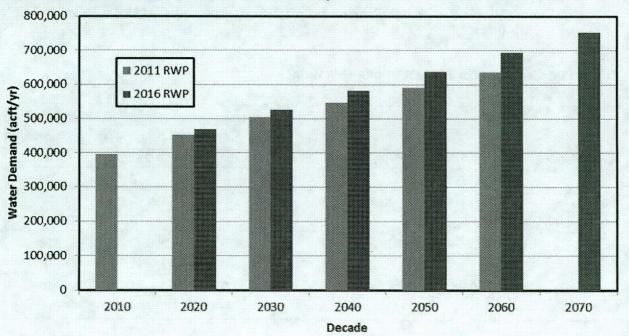

Figure 11.2-1 Municipal Water Demand Projections

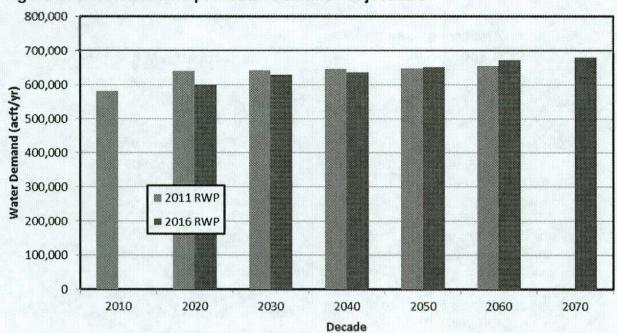

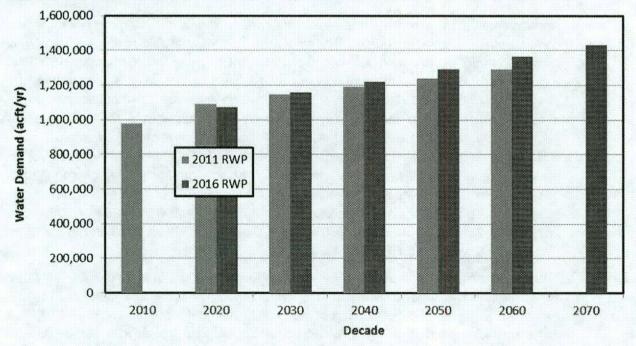

Figure 11.2-2 Non-Municipal Water Demand Projections

Figure 11.2-3 Total Water Demand Projections

Drought of Record and Assumptions

The drought of record in the Guadalupe-San Antonio River Basin is the drought of the 1950's which was most severe from 1947-1956. The drought of record did not change between the 2011 and 2016 SCTRWPs although more recent droughts may alter the drought of record for the 2021 regional water plan depending on the final severity and duration. Water modeling assumptions associated with both plans are listed in Table 11-2.

2011 SCTRWP	2016 SCTRWP
Edwards Aquifer CPM Consistent with SB3	Edwards Aquifer CPM Consistent with EAHCP
Groundwater Availability based on	Groundwater Availability based on
Various Model Runs	Modeled Available Groundwater
Existing Supply based on 2006 Effluent	Existing Supply based on 2006 Effluent

Commitments	Commitments
Surface Water Management Strategies	Surface Water Management Strategies
<u>include</u> Effluent Discharges adjusted for	<u>exclude</u> Effluent Discharges adjusted
Reuse Commitments	for Reuse Commitments
New Surface WMSs conform to Consensus Criteria for Environmental Flow Needs	New Surface WMSs conform to TCEQ Environmental Flow Standards

Table 11-2 Modeling Assumptions

Source Water Availability

Approximately 75 percent of the water available in the South Central Texas region comes from groundwater sources. The total groundwater available has stayed relatively constant throughout planning decades and consistent between the 2011 and 2016 Plans. Figure 11.2-4 shows that the groundwater availability has increased slightly during the 2016 planning cycle. Surface water availability which accounts for about 25 percent of availability in the region has also stayed relatively consistent, but is slightly greater for each decade in the 2016 SCTRWP (Figure 11.2-5). Assumptions used in calculating surface water availability for existing supply using TCEQ's GSAWAM were similar to those in the 2011 Region L Plan, with the only change being use of springflows consistent with the Edwards Aquifer Habitat Conservation Plan in the 2016 Region L Plan. The total water availability increases from 1,277,338 acft/yr in 2020 to 1,305,106 in 2070 in the 2016 plan. The total 2060 water availability projection is greater in the 2016 plan than in the 2011 plan (Figure 11.2-6).

There are significant differences in the modeling assumptions for technical evaluation of surface water availability for water management strategies in the 2011 and 2016 Plans. As shown in Table 11-2, evaluation of water management strategies in the 2016 Plan includes implementation of the EAHCP and TCEQ environmental flow standards and excludes treated effluent.

FR

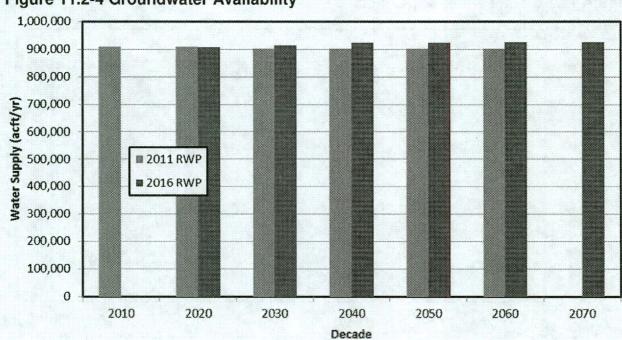

Figure 11.2-5 Surface water Availability

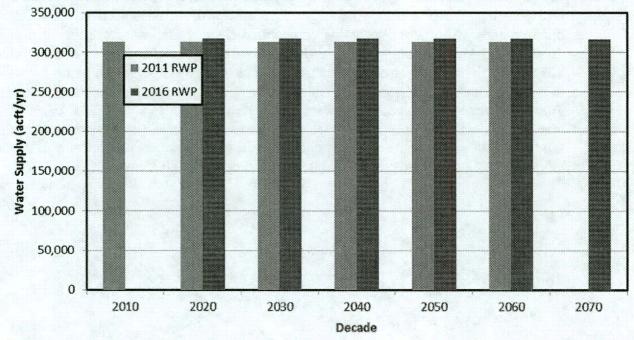

Figure 11.2-4 Groundwater Availability

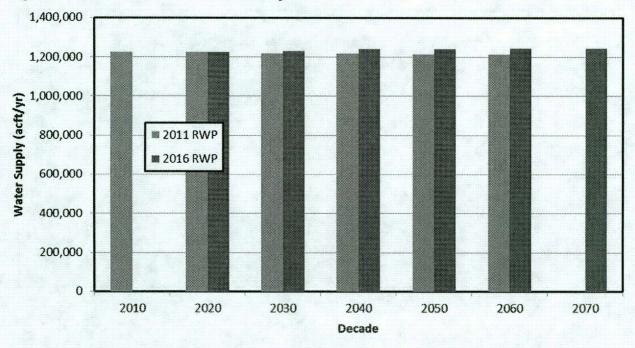

Figure 11.2-6 Total Water Availability

Existing Water Supplies

Existing Water Supplies for entities within Region L have changed significantly since the last planning cycle. Existing municipal supplies have increased on average by approximately 101,000 acft/yr for the comparable planning decades of 2020 through 2060 (Figure 11.2-7). Non-Municipal WUG supplies have decreased by an average of 103,500 acft/yr over the same four planning decades (Figure 11.2-8). Some of this is due to the shift due to acquisition of irrigation water rights by municipalities via Edwards Transfers. Implementation of the Edwards Aquifer Habitat Conservation Plan (EAHCP) may be contributing as well. Finally, new connected supplies have come online since the 2011 SCTRWP. Overall the total difference in existing supplies between planning cycles range from a 1,387 acft drop in 2020 to 9,392 acft drop in 2060 (Figure 11.2-9).

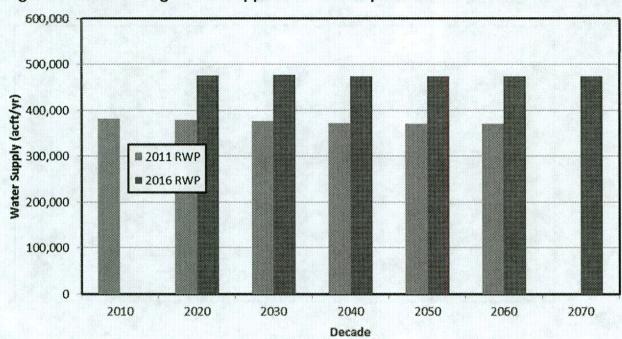

Figure 11.2-7 Existing Water Supplies for Municipal WUGs

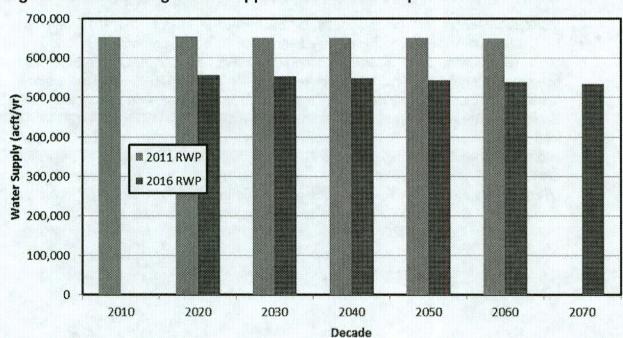

Figure 11.2-8 Existing Water Supplies for Non-Municipal WUGs

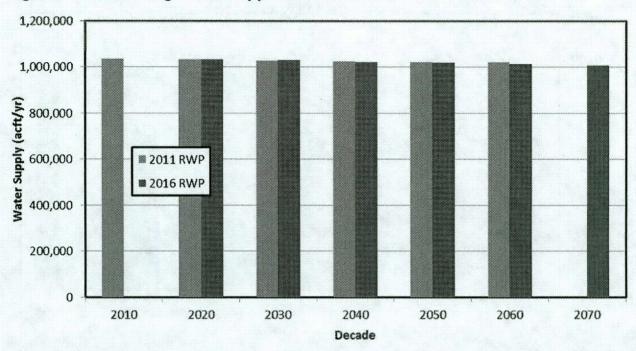

Figure 11.2-9 Existing Water Supplies for All WUGs

Needs

Municipal need projections increased for each decade in both the 2011 and 2016 SCTRWPs, however, the municipal needs are less for each comparable decade in the 2016 plan because there is more existing supply (Figure 11.2-10). On the other hand, non-municipal need projections have increased in the 2016 SCTRWP because there are more Steam-Electric demands, and increases in mining demands due to fracking in the Eagle Ford Shale formation, and decreases in existing supplies (Figure 11.2-11). The total WUG needs for the 2016 Plan increase from 207,214 in 2020 to 497,243 in 2070, and are greater than the needs in the 2011 Plan until 2060 where the 2011 projections are 2,005 acft/yr greater. The 2016 SCTRWP projections for Wholesale Water Provider (WWP) needs are less for every comparable decade than the 2011 SCTRWP projections (Figure 11.2-12). The WWP needs are currently projected to increase from 74,944 acft in 2020 to 403,947 acft in 2070.

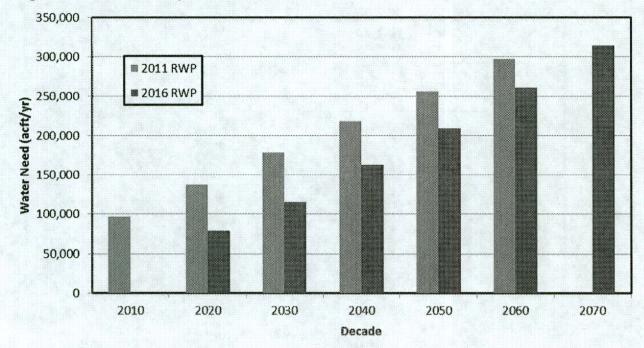

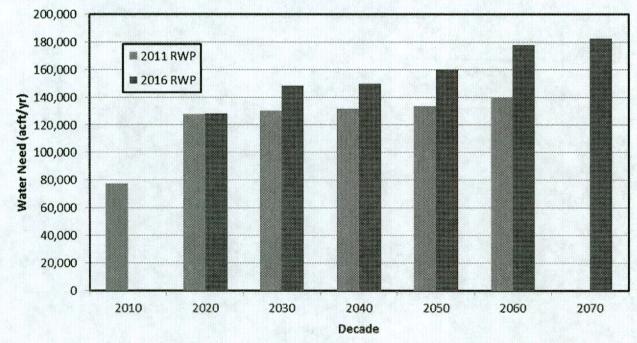

Figure 11.2-10 Municipal WUG Needs

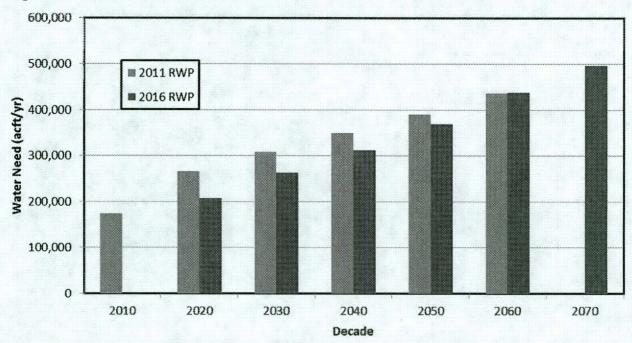

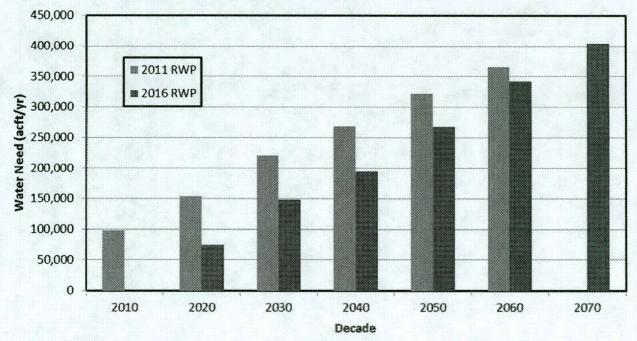

Figure 11.2-12 All WUG Needs

Recommended & Alternative Water Management Strategies

The completed 2011 SCTRWP included a total of 40 Recommended Water Management Strategies (WMSs) and 12 Alternative WMSs. The 2016 SCTRWP includes 60 recommended WMSs and 19 alternative WMSs. The total volume of recommended strategies increased by about 2.1 percent from 799,382 acft/yr to 816,705 acft/yr. The volume of alternative strategies increased significantly from 217,559 acft/yr to 518,219 acft/yr or an increase of 138 percent.

*WUG supplies and projected demands are entered for each of a WUG's region-county-basin divisions. To calculate the Management Supply Factor for each WUG as a whole, <u>not split</u> by region-county-basin the combined total of existing and future supply is divided by the total projected demand.

Append	lix A - County Level Summary of Estimated Economic Impacts for Region L	

Executive Summary

Evaluating the social and economic impacts of not meeting identified water needs is a required part of the regional water planning process. The Texas Water Development Board (TWDB) estimates those impacts for regional water planning groups, and summarizes the impacts in the state water plan. The analysis presented is for the Region L Regional Water Planning Group.

Based on projected water demands and existing water supplies, the Region L planning group identified water needs (potential shortages) that would occur within its region under a repeat of the drought of record for six water use categories. The TWDB then estimated the socioeconomic impacts of those needs—if they are not met—for each water use category and as an aggregate for the region.

The analysis was performed using an economic modeling software package, IMPLAN (Impact for Planning Analysis), as well as other economic analysis techniques, and represents a snapshot of socioeconomic impacts that may occur during a single year during a drought of record within each of the planning decades. For each water use category, the evaluation focused on estimating income losses and job losses. The income losses represent an approximation of gross domestic product (GDP) that would be foregone if water needs are not met.

The analysis also provides estimates of financial transfer impacts, which include tax losses (state, local, and utility tax collections); water trucking costs; and utility revenue losses. In addition, social impacts were estimated, encompassing lost consumer surplus (a welfare economics measure of consumer wellbeing); as well as population and school enrollment losses.

It is estimated that not meeting the identified water needs in Region L would result in an annually combined lost income impact of approximately \$2 billion in 2020, increasing to \$6 billion in 2070 (Table ES-1). In 2020, the region would lose approximately 18,300 jobs, and by 2070 job losses would increase to approximately 50,100.

All impact estimates are in year 2013 dollars and were calculated using a variety of data sources and tools including the use of a region-specific IMPLAN model, data from the TWDB annual water use estimates, the U.S. Census Bureau, Texas Agricultural Statistics Service, and Texas Municipal League.

Consumer surplus losses (\$ millions)*	\$29	\$58	\$108	\$171	\$264	\$403
Population losses	3,356	3,821	4,324	4,693	5,591	9,199
School enrollment losses	621	707	800	868	1,034	1,702

* Year 2013 dollars, rounded. Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000.

-

1 Introduction

Water shortages during a repeat of the drought of record would likely curtail or eliminate certain economic activity in businesses and industries that rely heavily on water. Insufficient water supplies could not only have an immediate and real impact on existing businesses and industry, but they could also adversely and chronically affect economic development in Texas. From a social perspective, water supply reliability is critical as well. Shortages could disrupt activity in homes, schools and government and could adversely affect public health and safety. For these reasons, it is important to evaluate and understand how water supply shortages during drought could impact communities throughout the state.

Administrative rules (31 Texas Administrative Code §357.33 (c)) require that regional water planning groups evaluate the social and economic impacts of not meeting water needs as part of the regional water planning process, and rules direct the TWDB staff to provide technical assistance upon request. Staff of the TWDB's Water Use, Projections, & Planning Division designed and conducted this analysis in support of the Region L Regional Water Planning Group.

This document summarizes the results of the analysis and discusses the methodology used to generate the results. Section 1 summarizes the water needs calculation performed by the TWDB based on the regional water planning group's data. Section 2 describes the methodology for the impact assessment and discusses approaches and assumptions specific to each water use category (i.e., irrigation, livestock, mining, steam-electric, municipal and manufacturing). Section 3 presents the results for each water use category with results summarized for the region as a whole. Appendix A presents details on the socioeconomic impacts by county.

1.1 Identified Regional Water Needs (Potential Shortages)

As part of the regional water planning process, the TWDB adopted water demand projections for each water user group (WUG) with input from the planning groups. WUGs are composed of cities, utilities, combined rural areas (designated as county-other), and the county-wide water use of irrigation, livestock, manufacturing, mining and steam-electric power. The demands are then compared to the existing water supplies of each WUG to determine potential shortages, or needs, by decade. Existing water supplies are legally and physically accessible for immediate use in the event of drought. Projected water demands and existing supplies are compared to identify either a surplus or a need for each WUG.

Table 1-1 summarizes the region's identified water needs in the event of a repeat of drought of the record. Demand management, such as conservation, or the development of new infrastructure to increase supplies are water management strategies that may be recommended by the planning group to meet those needs. This analysis assumes that no strategies are implemented, and that the identified needs correspond to future water shortages. Note that projected water needs generally increase over time, primarily due to anticipated population and economic growth. To provide a general sense of proportion, total projected needs as an overall percentage of total demand by water use category are presented in aggregate in Table 1-1. Projected needs for individual water user groups within the aggregate vary greatly, and may reach 100% for a given WUG and water use category. Detailed water needs by WUG and county appear in Chapter 4 of the 2016 Region L Regional Water Plan.

Water Use Categ	jory	2020	2030	2040	2050	2060	2070
Imination	Water Needs (acre-feet per year)	105,799	97,325	89,057	81,302	73,968	67,383

Table 1-1 Regional Water Needs Summary by Water Use Category

2 Economic Impact Assessment Methodology Summary

This portion of the report provides a summary of the methodology used to estimate the potential economic impacts of future water shortages. The general approach employed in the analysis was to obtain estimates for income and job losses on the smallest geographic level that the available data would support, tie those values to their accompanying historic water use estimate (volume), and thereby determine a maximum impact per acre-foot of shortage for each of the socioeconomic measures. The calculations of economic impacts were based on the overall composition of the economy using many underlying economic "sectors." Sectors in this analysis refer to one or more of the 440 specific production sectors of the economy designated within IMPLAN (Impact for Planning Analysis), the economic impact modeling software used for this assessment. Economic impacts within this report are

estimated for approximately 310 of those sectors, with the focus on the more water intense production sectors. The economic impacts for a single water use category consist of an aggregation of impacts to multiple related economic sectors.

2.1 Impact Assessment Measures

A required component of the regional and state water plans is to estimate the potential economic impacts of shortages due to a drought of record. Consistent with previous water plans, several key variables were estimated and are described in Table 2-1.

Table 2-1 Socioeconomic Impact Analysis Measures

Regional Economic Impacts	Description
Income losses - value added	The value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry, sector, or group of sectors within a year. For a shortage, value added is a measure of the income losses to the region, county, or WUG and includes the direct, indirect and induced monetary impacts on the region.
Income losses - electrical power purchase costs	Proxy for income loss in the form of additional costs of power as a result of impacts of water shortages.
Job losses	Number of part-time and full-time jobs lost due to the shortage.
Financial Transfer Impacts	Description
Tax losses on production and imports	Sales and excise taxes (not collected due to the shortage), customs duties, property taxes, motor vehicle licenses, severance taxes, other taxes, and special assessments less subsidies.
Water trucking costs	Estimate for shipping potable water.
Utility revenue losses	Foregone utility income due to not selling as much water.
Utility tax revenue losses	Foregone miscellaneous gross receipts tax collections.
Social Impacts	Description
Consumer surplus losses	A welfare measure of the lost value to consumers accompanying less water use.
Population losses	Population losses accompanying job losses.
School enrollment losses	School enrollment losses (K-12) accompanying job losses.

2.1.1 Regional Economic Impacts

Two key measures were included within the regional economic impacts classification: income losses and job losses. Income losses presented consist of the sum of value added losses and additional purchase costs of electrical power. Job losses are also presented as a primary economic impact measure.

Income Losses - Value Added Losses

Value added is the value of total output less the value of the intermediate inputs also used in production of the final product. Value added is similar to Gross Domestic Product (GDP), a familiar measure of the productivity of an economy. The loss of value added due to water shortages was estimated by inputoutput analysis using the IMPLAN software package, and includes the direct, indirect, and induced monetary impacts on the region.

Income Losses - Electric Power Purchase Costs

The electrical power grid and market within the state is a complex interconnected system. The industry response to water shortages, and the resulting impact on the region, are not easily modeled using traditional input/output impact analysis and the IMPLAN model. Adverse impacts on the region will occur, and were represented in this analysis by the additional costs associated with power purchases from other generating plants within the region or state. Consequently, the analysis employed additional power purchase costs as a proxy for the value added impacts for that water use category, and these are included as a portion of the overall income impact for completeness.

For the purpose of this analysis, it was assumed that power companies with insufficient water will be forced to purchase power on the electrical market at a projected higher rate of 5.60 cents per kilowatt hour. This rate is based upon the average day-ahead market purchase price of electricity in Texas from the recent drought period in 2011.

Job Losses

The number of jobs lost due to the economic impact was estimated using IMPLAN output associated with the water use categories noted in Table 1-1. Because of the difficulty in predicting outcomes and a lack of relevant data, job loss estimates were not calculated for the steam-electric power production or for certain municipal water use categories.

2.1.2 Financial Transfer Impacts

Several of the impact measures estimated within the analysis are presented as supplemental information, providing additional detail concerning potential impacts on a sub-portion of the economy or government. Measures included in this category include lost tax collections (on production and imports), trucking costs for imported water, declines in utility revenues, and declines in utility tax revenue collected by the state. Many of these measures are not solely adverse, with some having both positive and negative impacts. For example, cities and residents would suffer if forced to pay large costs for trucking in potable water. Trucking firms, conversely, would benefit from the transaction. Additional detail for each of these measures follows.

Tax Losses on Production and Imports

Reduced production of goods and services accompanying water shortages adversely impacts the collection of taxes by state and local government. The regional IMPLAN model was used to estimate reduced tax collections associated with the reduced output in the economy.

Water Trucking Costs

In instances where water shortages for a municipal water user group were estimated to be 80 percent or more of water demands, it was assumed that water would be trucked in to support basic consumption and sanitation needs. For water shortages of 80 percent or greater, a fixed cost of \$20,000 per acre-foot of water was calculated and presented as an economic cost. This water trucking cost was applied for both the residential and non-residential portions of municipal water needs and only impacted a small number of WUGs statewide.

Utility Revenue Losses

Lost utility income was calculated as the price of water service multiplied by the quantity of water not sold during a drought shortage. Such estimates resulted from city-specific pricing data for both water and wastewater. These water rates were applied to the potential water shortage to determine estimates of lost utility revenue as water providers sold less water during the drought due to restricted supplies.

Utility Tax Losses

Foregone utility tax losses included estimates of uncollected miscellaneous gross receipts taxes. Reduced water sales reduce the amount of utility tax that would be collected by the State of Texas for water and wastewater service sales.

2.1.3 Social Impacts

Consumer Surplus Losses of Municipal Water Users

Consumer surplus loss is a measure of impact to the wellbeing of municipal water users when their water use is restricted. Consumer surplus is the difference between how much a consumer is willing and able to pay for the commodity (i.e., water) and how much they actually have to pay. The difference is a benefit to the consumer's wellbeing since they do not have to pay as much for the commodity as they would be willing to pay. However, consumer's access to that water may be limited, and the associated consumer surplus loss is an estimate of the equivalent monetary value of the negative impact to the consumer's wellbeing, for example, associated with a diminished quality of their landscape (i.e., outdoor use). Lost consumer surplus estimates for reduced outdoor and indoor use, as well as residential and commercial/institutional demands, were included in this analysis. Consumer surplus is an attempt to measure effects on wellbeing by monetizing those effects; therefore, these values should not be added to the other monetary impacts estimated in the analysis.

Lost consumer surplus estimates varied widely by location and type. For a 50 percent shortage, the estimated statewide consumer surplus values ranged from \$55 to \$2,500 per household (residential use), and from \$270 to \$17,400 per firm (non-residential).

Population and School Enrollment Losses

Population losses due to water shortages, as well as the related loss of school enrollment, were based upon the job loss estimates and upon a recent study of job layoffs and the resulting adjustment of the labor market, including the change in population.¹ The study utilized Bureau of Labor Statistics data regarding layoffs between 1996 and 2013, as well as Internal Revenue Service data regarding migration, to model an estimate of the change in the population as the result of a job layoff event. Layoffs impact both out-migration, as well as in-migration into an area, both of which can negatively affect the population of an area. In addition, the study found that a majority of those who did move following a layoff moved to another labor market rather than an adjacent county. Based on this study, a simplified ratio of job and net population losses was calculated for the state as a whole: for every 100 jobs lost, 18 people were assumed to move out of the area. School enrollment losses were estimated as a proportion of the population lost.

2.2 Analysis Context

The context of the economic impact analysis involves situations where there are physical shortages of surface or groundwater due to drought of record conditions. Anticipated shortages may be nonexistent in earlier decades of the planning horizon, yet population growth or greater industrial, agricultural or other sector demands in later decades may result in greater overall demand, exceeding the existing supplies. Estimated socioeconomic impacts measure what would happen if water user groups experience water shortages for a period of one year. Actual socioeconomic impacts would likely become larger as drought of record conditions persist for periods greater than a single year.

2.2.1 IMPLAN Model and Data

Input-Output analysis using the IMPLAN (Impact for Planning Analysis) software package was the primary means of estimating value added, jobs, and taxes. This analysis employed county and regional level models to determine key impacts. IMPLAN is an economic impact model, originally developed by the U.S. Forestry Service in the 1970's to model economic activity at varying geographic levels. The model is currently maintained by the Minnesota IMPLAN Group (MIG Inc.) which collects and sells county and state specific data and software. The year 2011 version of IMPLAN, employing data for all 254 Texas counties, was used to provide estimates of value added, jobs, and taxes on production for the economic sectors associated with the water user groups examined in the study. IMPLAN uses 440 sector-specific Industry Codes, and those that rely on water as a primary input were assigned to their relevant planning water user categories (manufacturing, mining, irrigation, etc.). Estimates of value added for a water use category were obtained by summing value added estimates across the relevant IMPLAN sectors

¹ Foote, Andrew, Grosz, Michel, Stevens, Ann. "Locate Your Nearest Exit: Mass Layoffs and Local Labor Market Response." University of California, Davis. April 2015. http://paa2015.princeton.edu/uploads/150194

associated with that water use category. Similar calculations were performed for the job and tax losses on production and import impact estimates.

Note that the value added estimates, as well as the job and tax estimates from IMPLAN, include three components:

- Direct effects representing the initial change in the industry analyzed;
- *Indirect effects* that are changes in inter-industry transactions as supplying industries respond to reduced demands from the directly affected industries; and,
- Induced effects that reflect changes in local spending that result from reduced household income among employees in the directly and indirectly affected industry sectors.

2.2.2 Elasticity of Economic Impacts

The economic impact of a water need is based on the relative size of the water need to the water demand for each water user group (Figure 2-1). Smaller water shortages, for example, less than 5 percent, were anticipated to result in no initial negative economic impact because water users are assumed to have a certain amount of flexibility in dealing with small shortages. As a water shortage deepens, however, such flexibility lessens and results in actual and increasing economic losses, eventually reaching a representative maximum impact estimate per unit volume of water. To account for such ability to adjust, an elasticity adjustment function was used in estimating impacts for several of the measures. Figure 2-1 illustrates the general relationship for the adjustment functions. Negative impacts are assumed to begin accruing when the shortage percentage reaches the lower bound b1 (10 percent in Figure 2-1), with impacts then increasing linearly up to the 100 percent impact level (per unit volume) once the upper bound for adjustment reaches the b2 level shortage (50 percent in Figure 2-1 example).

Initially, the combined total value of the three value added components (direct, indirect, and induced) was calculated and then converted into a per acre-foot economic value based on historical TWDB water use estimates within each particular water use category. As an example, if the total, annual value added for livestock in the region was \$2 million and the reported annual volume of water used in that industry was 10,000 acre-feet, the estimated economic value per acre-foot of water shortage would be \$200 per acre-foot. Negative economic impacts of shortages were then estimated using this value as the maximum impact estimate (\$200 per acre-foot in the example) applied to the anticipated shortage volume in acre-feet and adjusted by the economic impact elasticity function. This adjustment varied with the severity as percentage of water demand of the anticipated shortage. If one employed the sample elasticity function shown in Figure 2-1, a 30% shortage in the water use category would imply an economic impact estimate of 50% of the original \$200 per acre-foot impact value (i.e., \$100 per acre-foot).

Such adjustments were not required in estimating consumer surplus, nor for the estimates of utility revenue losses or utility tax losses. Estimates of lost consumer surplus relied on city-specific demand curves with the specific lost consumer surplus estimate calculated based on the relative percentage of the city's water shortage. Estimated changes in population as well as changes in school enrollment were indirectly related to the elasticity of job losses.

Assumed values for the bounds b1 and b2 varied with water use category under examination and are presented in Table 2-2.

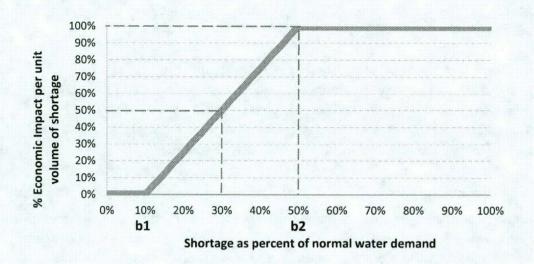

Figure 2-1 Example Economic Impact Elasticity Function (as applied to a single water user's shortage)

Table 2-2	Economic Ir	npact Elasticity	Function I	Lower and	Upper Bounds
		a prove same menty		LOUI DA DEALER	e pper sounds

Water Use Category	Lower Bound (b1)	Upper Bound (b2)		
Irrigation	5%	50%		
Livestock	5%	10%		
Manufacturing	10%	50%		
Mining	10%	50%		
Municipal (non-residential water intensive)	50%	80%		
Steam-electric power	20%	70%		

2.3 Analysis Assumptions and Limitations

Modeling of complex systems requires making assumptions and accepting limitations. This is particularly true when attempting to estimate a wide variety of economic impacts over a large geographic area and into future decades. Some of the key assumptions and limitations of the methodology include:

 The foundation for estimating socioeconomic impacts of water shortages resulting from a drought are the water needs (potential shortages) that were identified as part of the regional water planning process. These needs have some uncertainty associated with them, but serve as a reasonable basis for evaluating potential economic impacts of a drought of record event.

- 2. All estimated socioeconomic impacts are snapshot estimates of impacts for years in which water needs were identified (i.e., 2020, 2030, 2040, 2050, 2060, and 2070). The estimates are independent and distinct "what if" scenarios for each particular year, and water shortages are assumed to be temporary events resulting from severe drought conditions. The evaluation assumed that no recommended water management strategies are implemented. In other words, growth occurs, future shocks are imposed on an economy at 10-year intervals, and the resulting impacts are estimated. Note that the estimates presented were not cumulative (i.e., summing up expected impacts from today up to the decade noted), but were simply an estimate of the magnitude of annual socioeconomic impacts should a drought of record occur in each particular decade based on anticipated supplies and demands for that same decade.
- 3. Input-output models such as IMPLAN rely on a static profile of the structure of the economy as it appears today. This presumes that the relative contributions of all sectors of the economy would remain the same, regardless of changes in technology, supplies of limited resources, and other structural changes to the economy that may occur into the future. This was a significant assumption and simplification considering the 50-year time period examined in this analysis. To presume an alternative future economic makeup, however, would entail positing many other major assumptions that would very likely generate as much or more error.
- 4. This analysis is not a cost-benefit analysis. That approach to evaluating the economic feasibility of a specific policy or project employs discounting future benefits and costs to their present value dollars using some assumed discount rate. The methodology employed in this effort to estimate the economic impacts of future water shortages did not use any discounting procedures to weigh future costs differently through time.
- 5. Monetary figures are reported in constant year 2013 dollars.
- 6. Impacts are annual estimates. The estimated economic model does not reflect the full extent of impacts that might occur as a result of persistent water shortages occurring over an extended duration. The drought of record in most regions of Texas lasted several years.
- 7. Value added estimates are the primary estimate of the economic impacts within this report. One may be tempted to add consumer surplus impacts to obtain an estimate of total adverse economic impacts to the region, but the consumer surplus measure represents the change to the wellbeing of households (and other water users), not an actual change in the flow of dollars through the economy. The two categories (value added and consumer surplus) are both valid impacts but should not be summed.
- 8. The value added, jobs, and taxes on production and import impacts include the direct, indirect and induced effects described in Section 2.2.1. Population and school enrollment losses also indirectly include such effects as they are based on the associated losses in employment. The remaining measures (consumer surplus, utility revenue, utility taxes, additional electrical power purchase costs, and potable water trucking costs), however, do not include any induced or indirect effects.

11

- 9. The majority of impacts estimated in this analysis may be considered smaller than those that might occur under drought of record conditions. Input-output models such as IMPLAN only capture "backward linkages" on suppliers (including households that supply labor to directly affected industries). While this is a common limitation in these types of economic impact modeling efforts, it is important to note that "forward linkages" on the industries that use the outputs of the directly affected industries can also be very important. A good example is impacts on livestock operators. Livestock producers tend to suffer substantially during droughts, not because there is not enough water for their stock, but because reductions in available pasture and higher prices for purchased hay have significant economic effects on their operations. Food processors could be in a similar situation if they cannot get the grains or other inputs that they need. These effects are not captured in IMPLAN, which is one reason why the impact estimates are likely conservative.
- 10. The methodology did not capture "spillover" effects between regions or the secondary impacts that occur outside of the region where the water shortage is projected to occur.
- 11. The model did not reflect dynamic economic responses to water shortages as they might occur, nor does the model reflect economic impacts associated with a recovery from a drought of record including:
 - a. The likely significant economic rebound to the landscaping industry immediately following a drought;
 - b. The cost and years to rebuild liquidated livestock herds (a major capital item in that industry);
 - c. Direct impacts on recreational sectors (i.e., stranded docks and reduced tourism); or,
 - d. Impacts of negative publicity on Texas' ability to attract population and business in the event that it was not able to provide adequate water supplies for the existing economy.
- 12. Estimates for job losses and the associated population and school enrollment changes may exceed what would actually occur. In practice, firms may be hesitant to lay off employees, even in difficult economic times. Estimates of population and school enrollment changes are based on regional evaluations and therefore do not accurately reflect what might occur on a statewide basis.
- 13. The results must be interpreted carefully. It is the general and relative magnitudes of impacts as well as the changes of these impacts over time that should be the focus rather than the absolute numbers. Analyses of this type are much better at predicting relative percent differences brought about by a shock to a complex system (i.e., a water shortage) than the precise size of an impact. To illustrate, assuming that the estimated economic impacts of a drought of record on the manufacturing and mining water user categories are \$2 and \$1 million, respectively, one should be more confident that the economic impacts on manufacturing are twice as large as those on mining and that these impacts will likely be in the millions of dollars. But one should have less confidence that the actual total economic impact experienced would be \$3 million.

0

3 Analysis Results

This section presents a breakdown of the results of the regional analysis for Region L. Projected economic impacts for six water use categories (irrigation, livestock. municipal, manufacturing, mining, and steam-electric power) are also reported by decade.

3.1 Overview of the Regional Economy

Table 3-1 presents the 2011 economic baseline as represented by the IMPLAN model and adjusted to 2013 dollars for Region L. In year 2011, Region L generated about \$119 billion in gross state product associated with 1.4 million jobs based on the 2011 IMPLAN data. These values represent an approximation of the current regional economy for a reference point.

Table 3-1 Region L Economy

Income (\$ millions)*	Jobs	Taxes on production and imports (\$ millions)*
\$118,558	1,421,846	\$8,686

¹Year 2013 dollars based on 2011 IMPLAN model value added estimates for the region.

The remainder of Section 3 presents estimates of potential economic impacts for each water use category that could reasonably be expected in the event of water shortages associated with a drought of record and if no recommended water management strategies were implemented.

3.2 Impacts for Irrigation Water Shortages

Eight of the 21 counties in the region are projected to experience water shortages in the irrigated agriculture water use category for one or more decades within the planning horizon. Estimated impacts to this water use category appear in Table 3-2. Note that tax collection impacts were not estimated for this water use category. IMPLAN data indicates a negative tax impact (i.e., increased tax collections) for the associated production sectors, primarily due to past subsidies from the federal government. Two factors led to excluding any reported tax impacts: 1) Federal support (subsidies) has lessened greatly since the year 2011 IMPLAN data was collected, and 2) It was not considered realistic to report increasing tax revenue collections for a drought of record.

Impact Measure	2020	2030	2040	2050	2060	2070
Income losses (\$ millions)*	\$32	\$28	\$25	\$22	\$19	\$16
Job losses	1,377	1,233	1,091	950	814	701

Table 3-2 Impacts of Water Shortages on Irrigation in Region

* Year 2013 dollars, rounded. Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000.

3.3 Impacts for Livestock Water Shortages

None of the 21 counties in the region are projected to experience water shortages in the livestock water use category for one or more decades within the planning horizon. Estimated impacts to this water use category appear in Table 3-3. Note that tax impacts are not reported for this water use category for similar reasons that apply to the irrigation water use category described above.

Impact Measures	2020	2030	2040	2050	2060	2070
Income losses (\$ millions)*		-	-			-
Jobs losses						

* Year 2013 dollars, rounded. Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000

3.4 Impacts for Municipal Water Shortages

Seventeen of the 21 counties in the region are projected to experience water shortages in the municipal water use category for one or more decades within the planning horizon. Impact estimates were made for the two subtypes of use within municipal use: residential, and non-residential. The latter includes commercial and institutional users. Consumer surplus measures were made for both residential and non-residential demands. In addition, available data for the non-residential, water-intensive portion of municipal demand allowed use of IMPLAN and TWDB Water Use Survey data to estimate income loss, jobs, and taxes. Trucking cost estimates, calculated for shortages exceeding 80 percent, assumed a fixed cost of \$20,000 per acre-foot to transport water for municipal use. The estimated impacts to this water use category appear in Table 3-4.

Table 3-4 Impacts of Water Shortages on Municipal Water Users in Region

Impact Measures	2020	2030	2040	2050	2060	2070
Income losses ¹ (\$ millions)*	\$178	\$243	\$340	\$450	\$658	\$1,600
Job losses ¹	3,225	4,407	6,169	8,163	11,931	28,863

* Year 2013 dollars, rounded. Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000.

3.5 Impacts of Manufacturing Water Shortages

Manufacturing water shortages in the region are projected to occur in 6 of the 21 counties in the region for at least one decade of the planning horizon. Estimated impacts to this water use category appear in Table 3-5.

Table 3-5 Impacts of Water Shortages on Manufacturing in Region

Impacts Measures	2020	2030	2040	2050	2060	2070
Income losses (\$ millions)*	\$724	\$889	\$1,123	\$1,367	\$1,709	\$2,176
Job losses	8,455	10,113	12,091	14,005	16,702	20,267
Tax losses on production and Imports (\$ millions)*	\$44	\$55	\$71	\$89	\$113	\$148

* Year 2013 dollars, rounded. Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000.

3.6 Impacts of Mining Water Shortages

Mining water shortages in the region are projected to occur in 4 of the 21 counties in the region for at least one decade of the planning horizon. Estimated impacts to this water use type appear in Table 3-6.

Impact Measures	2020	2030	2040	2050	2060	2070
Income losses (\$ millions)*	\$925	\$895	\$743	\$432	\$177	\$48

Tax losses on production and Imports (\$ millions)*	\$114	\$110	\$92	\$53	\$22	\$6

Table 3-6	Impacts of	Water	Shortages on	Mining i	n Region
			Shortinget of		in resource

* Year 2013 dollars, rounded. Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000.

3.7 Impacts of Steam-Electric Water Shortages

Steam-electric water shortages in the region are projected to occur in 1 of the 21 counties in the region for at least one decade of the planning horizon. Estimated impacts to this water use category appear in Table 3-7.

Note that estimated economic impacts to steam-electric water users:

- Are reflected as an income loss proxy in the form of the estimated additional purchasing costs for power from the electrical grid that could not be generated due to a shortage;
- Do not include estimates of impacts on jobs. Because of the unique conditions of power generators during drought conditions and lack of relevant data, it was assumed that the industry would retain, perhaps relocating or repurposing, their existing staff in order to manage their ongoing operations through a severe drought.
- Does not presume a decline in tax collections. Associated tax collections, in fact, would likely increase under drought conditions since, historically, the demand for electricity increases during times of drought, thereby increasing taxes collected on the additional sales of power.

Table 3-7 Impacts of Water Shortages on Steam-Electric Power in Region

Income Losses (\$ millions)*	\$132	\$872	\$1,089	\$1,570	\$2,070	\$2,070
Impact Measures	2020	2030	2040	2050	2060	2070

* Year 2013 dollars, rounded. Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000.

3.8 Regional Social Impacts

Projected changes in population, based upon several factors (household size, population, and job loss estimates), as well as the accompanying change in school enrollment, were also estimated and are summarized in Table 3-8.

Impact Measures	2020	2030	2040	2050	2060	2070
Consumer surplus losses (\$ millions)*	\$29	\$58	\$108	\$171	\$264	\$403
Population losses	3,356	3,821	4,324	4,693	5,591	9,199
School enrollment losses	621	707	800	868	1,034	1,702

Table 3-8 Region-wide Social Impacts of Water Shortages in Region

* Year 2013 dollars, rounded. Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000.

Appendix A - County Level Summary of Estimated Economic Impacts for Region L

County level summary of estimated economic impacts of not meeting identified water needs by water use category and decade (in 2013 dollars, rounded). Values presented only for counties with projected economic impacts for at least one decade.

* Entries denoted by a dash (-) indicate no economic impact. Entries denoted by a zero (\$0) indicate income losses less than \$500,000

RE: HYDROLOGIC ASSUMPTIONS AND MODELS FOR USE IN THE 2016 SOUTH CENTRAL TEXAS REGIONAL WATER PLAN

Dear Ms. Callahan:

Pursuant to Texas Water Development Board (TWDB) General Guidelines for Regional Water Plan Development (2012-2016), the South Central Texas Regional Planning Group (SCTRWPG) respectfully requests your approval of the 2016 South Central Texas Regional Water Plan Hydrologic Assumptions and Operational Procedures for Assessment of Groundwater and Surface Water Supply (Attachment A). Contents of Attachment A were approved by consensus of the SCTRWPG during its meeting of February 2, 2012 and are consistent with such assumptions and procedures approved by the TWDB for our use in development of the 2001, 2006, and 2011 regional plans.

The SCTRWPG also respectfully requests your approval of our potential use, as necessary and appropriate, of the hydrologic models listed in Attachment B for regional water planning purposes. Contents of Attachment B were approved by consensus of the SCTRWPG during its meeting of February 2, 2012 and are consistent with hydrologic models approved by the TWDB for our use in development of the 2011 regional plan.

Should you or your staff need additional information regarding these requests, please contact Sam Vaugh (512-912-5142), Brian Perkins (512-912-5173), or me at your convenience.

Sincerely,

Con Mins,

South Central Texas Regional Water Planning Group

Attachment A 2016 South Central Texas Regional Water Plan

Hydrologic Assumptions and Operational Procedures for Assessment of Groundwater and Surface Water Supply

- 1) Full exercise of surface water rights. Data files updated with latest existing permanent water rights.
- 2) Edwards Aquifer withdrawals, critical period management, and resulting springflows consistent with Habitat Conservation Plan (Phase I) developed through the Edwards Aquifer Recovery Implementation Program (pending approval by USFWS) for the period 1947-1989. Pre-1947 withdrawals, critical period management, and resulting springflows consistent with SB 3 (80th Texas Legislature) using GWSIM-IV and historical Edwards Aquifer recharge estimates developed by EUWD/HDR.
- Operation of Canyon Reservoir at firm yield in accordance with Certificate of Adjudication No. 18-2074E, including subordination of all senior Guadalupe River hydropower permits to Canyon Reservoir.
- 4) Delivery of GBRA's present contractual obligations from Canyon Reservoir to points of diversion.
- 5) Effluent discharge / return flow in the Guadalupe San Antonio River Basin will be that reported for 2006 and adjusted for current SAWS direct recycled water commitments. Smaller reuse commitments of San Marcos, New Braunfels, Seguin, Kyle, San Antonio River Authority, and/or Cibolo Creek Municipal Authority, as well as others marketing reuse water (Gonzales, Kenedy, etc) may be considered to the extent data is available.
- 6) Operation of power plant reservoirs (Braunig, Calaveras, and Coleto Creek) subject to authorized consumptive uses at the reservoir, with makeup diversions as needed to maintain full conservation storage to the extent possible subject to senior water rights, instream flow constraints, and/or applicable contractual provisions.
- 7) Operation of Choke Canyon Reservoir/Lake Corpus Christi (CCR/LCC) System at safe yield subject to TCEQ Agreed Order regarding freshwater inflows to the Nueces Estuary.
- 8) Period of record for simulations: Guadalupe-San Antonio River Basin (1934-89, Critical Drought = 1950s) and Nueces River Basin (1934-97, Critical Drought = 1990s).
- 9) Firm supply of surface water rights based on monthly availability.

Mr. Con Mims, Chair South Central Texas Regional Water Planning Group c/o Nueces River Authority P.O. Box 349 Uvalde, Texas 78802

RE: Follow-up to South Central Texas Regional Water Planning Group's (SCTRWPG) Request for Approval of Hydrologic Assumptions and Models for Use in the 2016 South Central Texas Regional Water Plan

Dear Mr. Mims:

This letter is in response to our June 26, 2012 follow-up meeting with HDR at the Texas Water Development Board (TWDB). This letter confirms that TWDB approves:

- All assumptions and model modifications included in the February 9, 2012 request for the purpose of evaluating existing supplies. This includes the use of historically discharged effluent and corrected springflows from the Edwards Aquifer consistent with pumping restrictions associated with either: the EARIP HCP or current law under Senate Bill 3 passed by the 80th Texas Legislature.
- The use of the Region L GSA WAM which more accurately models the Canyon Reservoir permit, Coleto Creek Diversions, the Medina Lake System, and the CPS lakes (Calaveras and Braunig), also for the purpose of evaluating existing supplies.
- Evaluating all new WMSs using only the unmodified TCEQ WAM Run 3 models. The only exception to this is that TWDB approves the use of updated WAM spring flow files in these otherwise unmodified Texas Commission on Environmental Quality (TCEQ) WAM Run 3 models to reflect the existing withdrawal reduction levels and stages for critical period management that are current law under Senate Bill 3 passed by the 80th Texas Legislature. In addition, as of the date that the USFWS publishes its intent to issue an EARIP HCP permit in the Federal Register, TWDB also approves the use of updated WAM spring flow files in the otherwise

Our Mission

To provide leadership, planning, financial assistance, information, and education for the conservation and responsible development of water for Texas

Board Members

Billy R. Bradford Jr., Chairman Joe M. Crutcher, Vice Chairman Lewis H. McMahan, Member Edward G. Vaughan, Member Monte Cluck, Member F.A. "Rick" Rylander, Member

Melanie Callahan, Executive Administrator

Mr. Con Mims September 18, 2012 Page 2

> unmodified Texas Commission on Environmental Quality (TCEQ) WAM Run 3 models to reflect the anticipated withdrawal reduction levels and stages for critical period management associated with the EARIP HCP permit. Note that these same modified spring flow files are also approved for use in analyzing cumulative effects of the plan, if desired by the RWPG.

While TWDB authorizes certain modifications to evaluate existing water supplies for development of the 2016 South Central Texas Regional Water Plan, it is the responsibility of the RWPG to ensure that the resulting estimates of water availability are reasonable for drought planning purposes, will reflect conditions expected in the event of actual drought conditions, and in all other regards will be evaluated in accordance with the contract Exhibit C, General Guidelines for Regional Water Plan Development.

If you have any further questions, please do not hesitate to contact Mr. Matt Nelson, Project Manager for SCTRWPG, at (512) 936-3550 or via email at <u>matt.nelson@twdb.texas.gov</u>.

Sincerely,

Carolyn L. Brittin Deputy Executive Administrator Water Resources Planning and Information

Appendix M Public Comment and Plan Assessment Workgroup Recommendations

This page intentionally left blank.

Date: September 3, 2015

To: South Central Texas Regional Water Planning Group

From Con Mims

Re: Report from the Public Comment and Plan Assessment Workgroup (Workgroup)

The Workgroup met at 1:00 p.m., on August 19, 2015 in the San Antonio River Authority Board Room. Members present were:

Dianne Savage Russell Labus Alan Cockerell Chuck Ahrens Greg Sengelmann Tom Taggart Dianne Wassenich Jim Murphy Tommy Hill Donna Balin Iliana Pena

The Workgroup's charge was read, as follows:

August 14 was the deadline for submitting public comments on our Initially Prepared Plan (IPP). At our September 3 meeting, the planning group will consider how to respond to those comments. To facilitate this, the Workgroup will prepare recommended responses for the planning group's consideration. Also, the Workgroup will attempt to resolve concerns with our 2016 IPP that have been expressed in recent planning group meetings and in the public comments. The Workgroup will prepare recommended resolutions, where possible, for the planning group's consideration. Both issues will be addressed, concurrently, by the Workgroup.

To begin the meeting, the Workgroup agreed that public comments received on the Region L 2016 Initially Prepared Plan, generally, fell into three categories, being (1) state agency, (2) opposition to the Cibolo Valley Local Government Corporation Carrizo Water Management Strategy in Wilson County, and (3) other concerns.

1. Recommended Response to State Agency Comments

Our technical consultants presented their proposed responses to comments received from Texas Water Development Board and Texas Parks and Wildlife Department. The Workgroup agreed to recommend that the planning group accept the technical consultant's responses as the planning group's response to the state agency comments. The technical consultants' responses will be presented at the September 3 planning group meeting.

2. Recommended Response to Cibolo Valley Local Government Corporation Carrizo WMS Comments

It was noted that the agenda for the September 3 planning group meeting includes a vote to determine whether or not any version of the Cibolo Valley LGC Carrizo WMS will remain in the 2016 Plan. The Workgroup agreed to recommend that the planning group approve reference to this action as its response to all comments related to this issue.

3 Recommended Response to Other Comments

(a) The Workgroup discussed a process whereby the planning group, as a whole, over several meetings beginning with its first meeting in 2016, will discuss and take appropriate action on ways to improve its 2021 Plan based on comments received on its 2016 Plan. (I refer to this as the <u>2021 Plan Enhancement Process</u>.)

Subjects to be addressed in these meetings will include, but not be limited to:

- How Water Management Strategies are categorized; e.g. Recommended, Alternate, Needing Further Study.
- The appropriateness and adequacy of how demand and need are determined.
- The adequacy of environmental assessments of individual WMS's.
- The adequacy of evaluating the Plan's effects on freshwater inflows to San Antonio Bay.
- The extent to which innovative strategies should be used.
- A set of guiding principles to serve as a blueprint for long-term water sustainability.
- Evaluating the effects of reuse on stream flows and downstream water rights.
- Maintaining management supplies while avoiding "over planning".
- Defining conflicts of interests of consultants and planning group members.
- The role of regional water planning groups in influencing population growth and land use.
- The role of regional water planning groups in influencing water development plans of water suppliers.
- The role of regional water planning groups in influencing permitting entities.
- Identifying special studies or evaluations deemed important to enhance the 2021 Plan and identification of outside funding sources.
- Any other subjects that the planning group agrees to address.

With the exception of comments discussed in 3(b), below, the Workgroup felt that these topics cover all of the "other comments" received. The concept behind this proposal is that fair consideration of these

topics may result in improved future water plans or, at least, ones that have higher comfort levels with planning group members, and that such consideration cannot be achieved in one or two planning group meetings.

The Workgroup agreed to recommend that the planning group approve the following response to "other comments" that are covered by the subjects listed: "This comment will be addressed with a thorough discussion, along with a selection of other public comments received, in future Region L meetings, beginning in Calendar Year 2016, as part of an effort to use comments received on its 2016 Plan to improve its 2021 and future regional water plans".

(b) The following were identified as additional "other comments". The Workgroup **recommended the planning group approve the following responses.**

Regarding pipeline alignments and/or combining pipelines

"Pipeline alignments presented in the Water Management Strategies of the 2016 Region L Plan are conceptual routes to estimate costs to move water from the strategy source to the receiving Water User Group(s). It is up to the sponsoring entity(s) to perform engineering studies and design to refine pipeline alignments and determine the project specifics."

Regarding comments that are not pertinent to regional planning

"Any comments pertaining to water rates are outside the purview of the regional planning group. The specific rates charged by a water purveyor are set by the purveyor. The cost of a water management strategy is only one of many factors used in setting water rates."

Regarding conservation, including leaky pipes

"TWDB direction and the regional water planning process recognize the importance of water conservation as a primary water management strategy. The 2016 Region L Plan has a goal that is below the 140 gallons per capita per day (gpcd) set by the Water Conservation Implementation Task Force. Region L anticipates it will continue emphasis on conservation opportunities to reduce future gpcd goals."

Regarding conflict of interest for planning group membership

"Mr. Cockerell has been made aware of the requests to recuse himself from any vote on CVLGC water management strategies. Mr. Cockerell is one of three agricultural members on the South Central Texas Regional Planning Group."

This concluded the Workgroup's discussion.

Re: 2016 South Central Texas Region L Initially Prepared Plan

Dear Mr Raabe,

Thank you for seeking review and comment from the Texas Parks and Wildlife Department ("TPWD") on the 2016 Initially Prepared Regional Water Plan (IPP) for the South Central Texas Region L Water Planning Area (SCTRWPA). As you know, water impacts every aspect of TPWD's mission to manage and conserve the natural and cultural resources of Texas. As the agency charged with primary responsibility for protecting the state's fish and wildlife resources, TPWD is positioned to provide technical assistance during the water planning process. Although TPWD has limited regulatory authority over the use of state waters, TPWD is committed to working with stakeholders and others to provide science-based information during the water planning process intended to avoid or minimize impacts to state fish and wildlife resources.

TPWD understands that regional water planning groups are guided by 31 TAC §357 when preparing regional water plans. These water planning rules spell out requirements related to natural resource and environmental protection. Accordingly, TPWD staff reviewed the IPP with a focus on the following questions:

- Does the IPP include a quantitative reporting of environmental factors including the effects on environmental water needs and habitat?
- Does the IPP include a description of natural resources and threats to natural resources due to water quantity or quality problems?
- Does the IPP discuss how these threats will be addressed?
- Does the IPP describe how it is consistent with long-term protection of natural resources?
- Does the IPP include water conservation as a water management strategy?
- Does the IPP include Drought Contingency Plans?
- Does the IPP recommend any stream segments be nominated as ecologically unique?
- If the IPP includes strategies identified in the 2010 regional water plan, does it address concerns raised by TPWD in connection with the 2010 Water Plan.

4200 SMITH SCHOOL ROAD AUSTIN, TEXAS 78744-3291 512.389.4800

www.tpwd.texas.gov

To manage and conserve the natural and cultural resources of Texas and to provide hunting, fishing and outdoor recreation opportunities for the use and enjoyment of present and future generations.

Mr. Steven J. Raabe Page 2 of 3 August 07, 2015

The population of the 20 county SCTRWPA is estimated to grow from about 3.0 million in 2020 to about 5.2 million by 2070. Water needs are expected to more than double during this time period but water conservation, including drought management, and water reuse are expected to meet 34 percent of future water needs. In addition, the Edwards Aquifer Habitat Conservation Plan (EAHCP) is identified as both an existing supply and a future water management strategy. Full implementation of the EAHCP provides future water supply while protecting springflows at Comal and San Marcos Springs, thereby protecting associated ecosystems and the federally threatened and endangered species that are found there. The IPP includes the development of two seawater desalination projects, comprising 23 percent of future supplies. Four new aquifer storage and recovery (ASR) projects are recommended in the IPP to provide approximately 9 percent of future supplies in the region. From the perspective of environmental impacts, ASR projects are generally preferred over surface reservoirs since habitat impacts can be minimized. Finally, new surface water development projects such as the GBRA Lower Basin Project are expected to meet 1 percent of future needs.

The IPP includes a detailed quantitative reporting of environmental factors. Volume II of the IPP discusses technical evaluations of strategies and presents water management strategy summary sheets that include acreages impacted by each strategy. An analysis of cumulative environmental impacts, as well as comparisons to cumulative impacts from past plans, is also included. Where applicable, newly adopted SB3 environmental flow standards are used to evaluate environmental flow requirements.

The IPP includes a description of natural resources including fish and wildlife resources. A detailed table listing threatened and endangered species by county with notations concerning their habitat preferences and protected status is presented in Appendix G of the IPP. Major springs are also described and potential threats to natural resources were evaluated. TPWD recommends including a discussion of aquatic exotic species including but not limited to tilapia and sailfin catfish.

Quantitative environmental assessments are presented for proposed water management strategies included in the 2016 IPP as well as for the 1984, 1990, 1997, 2002, 2007 and 2012 Water Plans. While necessarily broad in scope, this quantitative analysis comparing each water plan highlights some interesting trends. For example, while the overall environmental impact score for the 2016 IPP is in the midrange compared to previous water plans for the region, it has a higher potential to impact endangered, threatened, and species of concern due to the number of projects and pipelines traversing sensitive areas. The 2016 IPP is also projected to have less impact than previous plans on vegetation and wildlife habitat, largely due to the absence of large main-stem reservoirs included in earlier plans. Finally, the 2016 IPP appears to project moderate water quality and aquatic habitat impacts. Overall the 2016 IPP is projected to have slightly greater cumulative impacts than the 2012 plan for this region. While specific conclusions cannot be made at this point, TPWD staff tends to agree with the statement that the predicted impacts associated with the smaller (but more numerous) strategies in the 2016 IPP may be more easily avoided and/or mitigated than the large scale impacts associated with reservoirs in earlier water plans.

The SCTRWPG is to be commended for its strong emphasis on water conservation, reuse and drought contingency planning. The IPP includes municipal water conservation water management strategies. Water conservation in the industrial and steam-electric power generation use categories are encouraged as well. According to the IPP, per capita water use in Region L is projected to

Mr. Steven J. Raabe Page 3 of 3 August 07, 2015

decline over the planning period from 140 gallons per person per day in 2020 to 130 gallons per person per day in 2070, bringing it under the Texas Water Conservation Task Force goal of 140 gallons per person per day.

While TPWD is pleased to see that many of our earlier comments have been addressed, concerns remain regarding potential impacts associated with several strategies. Several water management strategies are recommended for stream segments identified by TPWD as ecologically significant. Increased groundwater development may impact small springs and adversely impact groundwater-surface water interactions. New appropriations from the Guadalupe River and/or increased use of previously unused water rights from the Guadalupe River will impact instream flows and freshwater inflows to San Antonio Bay that will likely reduce long-term inflows and increase bay salinities, potentially leading to complex estuarine community changes. Both seawater and brackish groundwater desalination can be ecologically advantageous strategies, as long as issues such as impingement and entrainment at intake locations and brine disposal options are carefully considered. Continued consultation with TPWD staff will help to ensure that fish and wildlife impacts can be avoided or minimized. Please be advised that HB 2031 passed by the 84th legislature requires consultation with TPWD and the General Land Office regarding siting of seawater desalination intakes and discharges.

The 2016 IPP is a well written and organized report. TPWD highly commends SCTRWPG's efforts that have resulted in the successful designation of five segments recommended in the IPP as ecologically unique. Recognition is deserved for drought management as a water management strategy, aquifer storage and recovery projects, seawater desalination, use of off-channel reservoirs, use of recycled water for non-potable uses for several water user groups, and an ecological analysis of the impact of the 2016 plan. No major on-channel reservoirs are proposed within the region at this time.

Thank you for your consideration of these comments. TPW looks forward to continuing to work with the planning group to develop water supply strategies that not only meet the future water supply needs of the region but also preserve the ecological health of the region's aquatic resources. Please contact Cindy Loeffler at (512) 389-8715 if you have any questions or comments.

Sincerely, har

Ross Melinchuk, Deputy Executive Director, Natural Resources

Re: Texas Water Development Board Comments on the South Central Texas Regional Water Planning Group (Region L) Initially Prepared Plan, Contract No. 1148301323

Dear Mr. Mims and Mr. Ruiz:

Texas Water Development Board (TWDB) staff completed a review of the Initially Prepared Plan (IPP) submitted by May 1, 2015 on behalf of the Region L Regional Water Planning Group. The attached comments follow this format:

- Level 1: Comments, questions, and online regional water planning database revisions that must be satisfactorily addressed in order to meet statutory, agency rule, and/or contract requirements; and,
- Level 2: Comments and suggestions for consideration that may improve the readability and overall understanding of the regional water plan.

The TWDB's statutory requirement for review of potential interregional conflicts under Title 31 Texas Administrative Code (TAC) §357.62 will not be completed until submittal and review of adopted regional water plans. However, as previously requested by our Executive Administrator, please inform TWDB in advance of your final plan if your planning group believes that an interregional conflict exists. Additionally, subsequent review will be performed as the planning group completes its data entry into the regional water planning database (DB17). If issues arise during our ongoing data review, they will be communicated promptly to the planning group to resolve.

Our Mission

Board Members

To provide leadership, information, education, and support for planning, financial assistance, and outreach for the conservation and responsible development of water for Texas

Bech Bruun, Chairman | Carlos Rubinstein, Member | Kathleen Jackson, Member

Kevin Patteson, Executive Administrator

Mr. Con Mims Mr. Cole Ruiz July 21, 2015 Page 2

Title 31 TAC§357.50(d) requires the regional water planning group to consider timely agency and public comment. Section 357.50(e) requires the final adopted plan include summaries of all timely written and oral comments received, along with a response explaining any resulting revisions or why changes are not warranted. Copies of TWDB's Level 1 and 2 written comments and the region's responses must be included in the final, adopted regional water plan. While the comments included in this letter represent TWDB's review to date, please anticipate the need to respond to additional comments regarding data integrity, including any water source overallocations, in the regional water planning database (DB17) once data entry is completed by the region.

Standard to all planning groups is the need to include certain content in the final regional water plans that was not yet available at the time that IPPs were prepared and submitted. In your final regional water plan, however please be sure to also incorporate the following:

- a) Completed results from the regional planning group's infrastructure financing survey (IFR) for sponsors of recommended projects with capital costs [31 TAC §357.44];
- b) Completed results from the implementation survey [31 TAC §357.45(a)];
- c) The socioeconomic impact evaluation provided by TWDB at the request of the planning group [31 TAC §357.33(c)];
- d) Documentation that comments received on the IPP were considered in the development of the final plan [31 TAC §357.50(d)];
- e) Evidence, such as a certification, that the final, adopted regional water plan is complete and adopted by the planning group [31 TAC §357.50(j)(1)]; and,
- f) The required DB17 reports, as made available by TWDB, in the executive summary or elsewhere in the plan as specified in the Contract [31 TAC §357.50(e)(2)(B), Contract Scope of Work Task 4D(p), Contract Exhibit 'C', Table 2]. Please ensure that the numerical values presented in the tables throughout the final, adopted regional water plan are consistent with the data provided in DB17. For the purpose of development of the 2017 State Water Plan, water management strategy and other data entered by the regional water group in DB17 (and as presented in the regional plan) shall take precedence over any conflicting data presented in the final regional water plan [Contract Exhibit 'C', Sections 12.1.3. and 12.2.2].

The following items must accompany, separately, the submission of the final, adopted regional water plan:

- The prioritized list of all recommended projects in the regional water plan [Texas Water Code 15.436(a), Contract Scope of Work Task 13]; and,
- Any remaining hydrologic modeling files or GIS files that may not have been provided at the time of the submission of the IPP but that were used in developing the final plan. [31 TAC §357.50(e)(2)(C), Contract Exhibit 'C', Section 12.2.1; Contract Scope of Work Task 3-III-13]

Note that provision of certain content in an electronic-only form is permissible as follows: Internet links are permissible as a method for including model conservation and drought contingency plans within the final regional water plan; hydrologic modeling files may be submitted as electronic appendices, however

Mr. Con Mims Mr. Cole Ruiz July 21, 2015 Page 3

all other regional water plan appendices should be incorporated in hard copy format within each plan [31 TAC §357.50(e)(2)(C), Contract Scope of Work Task 5e, Contract Exhibit 'C', Section 12.2.1].

The following general requirements that apply to recommended water management strategies must be adhered to in all final regional water plans including:

- Regional water plans must not include any strategies or costs that are associated with simply maintaining existing water supplies or replacing existing infrastructure. Plans may include only infrastructure costs that are associated with volumetric increases of treated water supplies delivered to water user groups or that result in more efficient use of existing supplies [31 TAC §357.10(28), §357.34(d)(3)(A), Contract Exhibit 'C", Section 5.1.2.2, Section 5.1.2.3]; and,
- Regional water plans must not include any retail distribution-level infrastructure costs (other than those costs related to conservation strategies such as water loss reduction) [31 TAC §357.10(28), §357.34(d)(3)(A), Contract Exhibit 'C", Section 5.1.2.3].

To facilitate efficient and timely completion, and Board approval, of your final regional water plan, please provide your TWDB project manager with early drafts of your responses to these IPP comments for preliminary review and feedback.

If you have any questions regarding these comments or would like to discuss your approach to addressing any of these comments, please do not hesitate to contact Temple McKinnon at (512) 475-2057. TWDB staff will be available to assist you in any way possible to ensure successful completion of your final regional water plan.

incerely. Jeff

DeputyExecutive Administrator Water Supply and Infrastructure

ATTACHMENT A

TWDB Comments on the Initially Prepared 2016 South Central Texas (Region L) Regional Water Plan

Level 1: Comments and questions must be satisfactorily addressed in order to meet statutory, agency rule, and/or contract requirements.

1. Tables 2-10 through 2-17: It is not clear whether the information provided in the tables referenced presents the current contractual obligations of wholesale water providers (WWPs) in the region. Please confirm in the final, adopted regional water plan. [31 Texas Administrative Code (TAC) §357.31(c)]

Response: Text has been added to Page 2-16 to clarify.

2. The plan in some instances, does not appear to include a quantitative reporting of impacts to agricultural resources. For example, strategy evaluations 5.2.9, 5.2.11, 5.2.14, 5.2.21, 5.2.23-27, 5.2.34, 5.2.35, and 5.2.37 do not appear to include quantified impacts to agricultural resources. Please include quantitative reporting of impacts to agricultural resources, including when there is no impact, in the final, adopted regional water plan. [31 TAC §357.34 (d)(3)(C)]

Response: Text has been added to Page 6-59 to address region-wide agricultural impacts. In addition, text has been added to water management strategy evaluations to address strategy-specific impacts, if any.

3. Pages 5.3-18, 5.3-23, and 5.3-90: The plan does not appear to include conservation practices for all water user groups to which Texas Water Code (TWC) §11.1271 and §13.146 apply. For example, the City of Kirby and East Central SUD and Green Valley SUD to which these Water Code requirements apply. Please address this requirement in the final, adopted regional water plan. [31 TAC §357.34(f)(2)(A]

Response: Projected per capita water goals with use of low flow plumbing fixtures for these three entities (and potentially others) are lower than the stated Region L advanced water conservation goals.

4. Volume II, Section 5.2.3: The Facilities Expansion Water Management Strategy appears, in some cases, to include infrastructure components that do not appear to increase the supply to end users. For example, the Port O'Connor treatment and distribution system improvements. Water management strategy components included in regional water plans must be limited to the infrastructure required to develop and convey increased water supplies from sources and to treat the water for end user requirements. Maintenance of existing equipment or wells or improvements to treatment processes shall not be included as a recommended strategy with capital costs. Please remove these strategies and costs from the final, adopted regional water plan. [Contract Exhibit 'C', Sections 5.1.2.2 and 5.1.2.3]

Response: Section 5.2.3 has been revised to exclude Port O'Connor's treatment and distribution system improvements.

5. Volume II, Sections 5.2.35 and 5.2.40: Please clarify in the plan whether the evaluations of water management strategies for "GBRA Lower Basin Storage" and "Lavaca River - OCR "are based on an unmodifed Texas Commission on Environmental Quality (TCEQ) WAM Run 3 in the final, adopted regional water plan. If not, please evaluate these strategies using an unmodified TCEQ WAM Run3 for the final, adopted regional water plan. [Contract Exhibit 'C', Section 3.4.2]

Response: Sections 5.2.35 and 5.2.40 have been revised to clarify.

6. Chapter 7: The plan does not appear to summarize information on existing emergency interconnections. Please indicate whether any local drought contingency plans involve making emergency connections between water systems or WWP systems and, if so, please also provide a general description in the final, adopted regional water plan. [31 TAC §357.42(e)]

Response: Sections 7.3 and 7.4 summarize this information. Separate documentation was provided to TWDB relating to specific information for existing interconnects. Table 7.4-1 has been revised to indicate emergency interconnections in local drought contingency plans.

7. Section 7.7: Please indicate how the planning group considered relevant recommendations from the Drought Preparedness Council (a letter was provided to planning groups with relevant recommendations in November 2014) in the final, adopted regional water plan. [31 TAC §357.42(h)]

Response: Text has been added to Page 7-15 to address the Drought Preparedness Council's letter.

8. Chapter 10: The plan does not include documentation regarding the public process during the development of regional water plan. Please clarify whether the regional water plan was developed in accordance with the public participation requirements of the Texas Open Meetings Act in the final, adopted regional water plan. [31 TAC §357.21, §357.50(d)]

Response: Chapter 10 will be included in the final 2016 South Central Texas Regional Water Plan, detailing the public process, the public hearings, and the responses to comments.

9. Please provide a statement regarding any water availability requirements promulgated by a county commissioners court pursuant to TWC §35.109, which in Region L applies to the northern Bexar County, Hays, Comal, and Kendall County Priority Groundwater Management Area. [31 TAC §357.22(a)(6)]

Response: Text has been added to Page 3-2 to address Priority Groundwater Management Areas and any requests from county commissioners courts.

10. Please describe how the Texas Clean Rivers Program was considered in the final, adopted regional water plan. [31 TAC §357.22(a)(7)]

Response: Text has been added to Page 1-31 to address the Texas Clean Rivers Program.

11. Please clarify whether the plan development was guided by the principal that the designated water quality and related water uses as shown in the state water quality management plan shall be improved or maintained. [31 TAC §358.3(19)]

Response: Text has been added to Page 1-31 to address the state water quality management plan.

Level 2: Comments and suggestions for consideration that may improve the readability and overall understanding of the regional water plan.

1. Please consider including a brief explanation of the differences between the 2011 and 2016 plans regarding surface water availability in the final, adopted regional water plan.

Response: Text has been added to Page 11-4 to describe the differences in the surface water availability in the 2011 and 2016 Region L Plans.

2. In the development of region-specific drought contingency plans, please consider including, at a minimum, triggers and responses for 'severe' and 'critical/emergency' drought conditions or indicate how these would be captured with the use of the recommended TCEQ templates in the final, adopted regional water plan.

Response: Section 7.5 includes information about Region Specific Drought Response. Text has been added to Tables 7.5-1 and 7.5-2 to indicate the 'severe' and 'critical/emergency' stages of the drought contingency plans.
